FOREWORD

This is a Special Release of Official Munitions Production of the United States containing data on actual production by months from July 1, 1940, the beginning of the War Program, through August 31, 1945, the last month of actual fighting against Japan. There were 41 regular monthly issues of this report prepared under a directive from the Chairman of the War Production Board, dated March 13, 1942, calling for the regular compilation of a body of official data on munitions production. OMPUS No. 1 was dated April 1, 1942; OMPUS No. 41, which contained the last official schedules issued prior to the surrender of Japan, was dated August 1, 1945.

The standards under which all issues of OMPUS (including this Special Release) were prepared, were determined by the Advisory Committee on Official Production Statistics, a committee established pursuant to the Chairman of the War Production Board's directive, and selected to represent all of the various interested war agencies.

Original Purpose and Development of OMPUS

A quotation from the Foreword of Issue No. 1, of OMPUS, dated April 1, 1942, indicates the document's original intent and significance during the war as a single over-all document, containing the munitions figures of all of the procurement services—"It has become increasingly important to have one set of munitions production figures which represent accurate records of performance and which present the most realistic available forecasts of production—one set of figures which are recognized as having official status."

The early issues of OMPUS were set up primarily by Raymond G. Fisher, the first editor, subject to approval by Stacy May, then Director of the Bureau of Planning and Statistics, and Morris Copeland, then Chief of the Munitions Branch. Early development of the report was due in large part also to the work of J. A. Zettler, Ben T. Moore, and Robert Mitchell.

Data in This Special Release

The report presents data furnished by the war procurement agencies and is, therefore, the result of a cooperative effort in which all of these agencies have participated. The data have been validated by the war procurement agencies concerned and are the official statements of actual United States munitions production for the items included, and for the period covered. The data are believed to be final in practically all cases, but occasional items may be subject to some later revision by the procurement agency concerned.

Classification of Data

The munitions production data series, which comprise the major portion of this Special Release, are arranged under a classification of seven major categories in the following order: aircraft, ships, guns and small arms (including fire control, n.e.c.), ammunition and bombs, combat and motor vehicles, communications and electronic equipment, and other equipment and supplies. This classification is based on the Standard Commodity Classification, so that similar items are shown together or near each other, yet some variations have been made from it to permit traditional groupings of items by end use and by procuring service. The table of contents indicates the method of organization of the entire report.

Preparation of This Special Release

Data for this special issue were prepared in the Military Division of the Program and Statistics Bureau, War Production Board, from all available published sources put out by the Services, and then were sent to the Services for checking and incorporation of revisions which had never appeared in any of the regular monthly procurement reports. The production series for hundreds of items were amended back to 1940 by reason of such revisions and corrections; the data on actual production reported in this Special Release should be accepted in preference to any other data on actual production shown in earlier regular monthly issues of OMPUS.

Listed below, in order of presentation in the volume, are some additional features of this issue which were prepared especially for it and were not contained in the last regular monthly issues of OMPUS.

1. Airframe weight of complete units plus spare parts, by type of plane, is shown for the first time in the Aircraft Section.

2. Practice and drill ammunition for artillery and mortars, with a tonnage total for the category, is also shown for the first time, in the Ordnance and Automotive Vehicles Section.

3. Canadian production of Army Ordnance and Vehicles items under United States War Department contracts has been restored to this Special Release, and is shown in the Ordnance and Automotive Vehicles Section. (These data had been included in early issues of the regular OMPUS series, but were eliminated when most of the programs were completed.)

4. Production in the United States for purchase by foreign governments and purchasing missions is shown in the Ordnance and Automotive Vehicle Section. This production, although not for our own Army, is important in any consideration of United States' munitions production during the early part of the war program, since foreign orders made it possible for many manufacturers to get under way on munitions production when United States orders were still in small volume. It is believed that this information is not available elsewhere within the United States Government, since it was gathered from each separate supply mission by WPB personnel.

5. Coverage of many regular sections has been improved for this special issue; this is especially true for items classified under the section on Other Equipment and Supplies.

6. Three special supplements have been added.

a. Text Supplement

The text supplements, prepared originally by the staffs of the various branches and sections of the Military Division, attempt to point up the important features of production in each particular munitions area, as well as to indicate some of the major difficulties affecting production during the war period.

b. Chart Supplement

The eleven charts, all of the same general pattern, illustrate graphically the tremendous amounts of various types of munitions produced during the war program; they show also some of the major trends within groups which are mentioned in the texts or shown in detail in the data sections.

c. The Canadian Supplement

The Canadian Supplement to OMPUS, shown under separate covers for all of the later regular monthly issues of OMPUS, is included in this Special Release to complete the picture of munitions production on the North American continent. Data contained in the U.S.-Canadian Supplement were important to United States agencies procuring munitions, since Canada depended on United States sources for many components which used raw materials and had to come out of our own component production. They were also of some importance in helping to indicate the size of the shipping problem for end items of munitions equipment from North America to the various theatres of war.

TABLE OF CONTENTS

SECTION — Page

I. AIRCRAFT
- Airplanes
  - Summary 1
  - Bomber 5
  - Fighter 13
  - Reconnaissance (incl. Photographic) 18
  - Transport 19

Source of Data - Analysis and Plans Branch, Deputy for Plans and Administration, Assistant Chief of Air Staff-4, Army Air Forces.
Stage of Completion - Acceptance at plants; accepted planes may lack some components normally installed at plants.
a Acceptances in model and plant sections exclude experimental models. This program is shown in detail in Table II, page 56.
b Excluding airframe weight of spare parts for U.S.-financed Canadian production; these data are not available.
c Army and Navy cognizance indicates the agency which has primary responsibility for procurement and inspection. In case of direct foreign purchases, assignment is based on type of plane.
d Excluding equivalent airframe weight of spare parts; these data are not available.

AIRPLANES

[a] Production of PB2Y subsequent to October 1943 is shown as PB2Y-3R, Heavy Transport, 4-engine.

[b] Ventura production prior to February 1943 is classified as B-34, Medium Bomber, by agreement of the Army and Navy.

[c] Excluding equivalent airframe weight of spare parts; these data are not available.

a Including all commercial transports 12-place or more.
b The airframe weight data shown in the detail on types of transports are not adjusted for rounding; therefore they do not necessarily add to the monthly totals shown in this column.
c Excluding equivalent airframe weight of spare parts; these data are not available.

[a] The B-34 and the PV-1 are essentially the same planes. By mutual agreement between the War and Navy Departments, all Venturas accepted prior to February 1943 are classified as B-34 Medium Bombers (Army Cognizance) and all Venturas accepted after that time as PV-1 Patrol Bombers (Navy Cognizance).

EXPLANATORY NOTES
AIRCRAFT

Source of Data

See first page of each section.

Description of Data

Airplanes, Special Purpose Aircraft, Gliders, and Special Devices

Acceptances at Plants

"Acceptance" is defined as the conveyance of legal title to the contracting agency. Planes were originally accepted at the airframe plant sometimes short of certain equipment normally installed at plants, or they may have been modified after acceptance for specific missions or purposes. After June 1944, the practice of accepting planes after modification, and at the centers or plants performing this function, became increasingly customary.

Acceptances January - June 1940

Airplane acceptances for the first half of 1940 are not shown in the main body of this report. Table I on page 54, is a detailed summary of acceptances for this period.

Airframe Weight

"Airframe weight" is defined as airplane empty minus the weight of: engine (dry weight); propeller hubs, blades, power control, and governor; wheels, brakes, tires, and tubes; auxiliary power plant; turbo superchargers; radio receivers; radar; transmitters and removable units (but not installation parts and wiring); starter; battery; generator; turrets; and power operated gun mounts, including remote gun sighting stations.

Airframe weight of complete units has been developed by the number of acceptances multiplied by the unit airframe weight as shown in WS-1007 (Unit Airframe Weight Report).

Airframe weight of complete units including corresponding equivalent weights of spare parts has been determined by relating the dollar value of spare parts shipped on aircraft contracts to the dollar value of complete units accepted during the same month as submitted in Aeronautical Monthly Progress Report #6 and applying the ratio to the airframe weight of complete units accepted. The June 1945 ratios were used in computing July and August 1945 figures, since there was no AMPR #6 available on these last two months. In cases where no complete units were accepted during month but spare parts were shipped against a contract, the dollar value was converted into complete units, by the application of the standard ten dollars a pound to the total dollar value of the spare parts shipped for that month.

Experimental Models

All experimental models are excluded from the model and plant sections of this report. Table II on page 56, contains a detailed summary of experimental aircraft acceptances.

Canadian Production

Canadian production includes only those programs financed by the United States, and considered to be a portion of our own program. Total Canadian airplane production is shown beginning on page 375.

Commercial Airplanes

Civil transport planes of 12 or more places are included in the main tables, but smaller aircraft produced on commercial contracts are excluded. Acceptances of these light commercial planes totaled 633 in 1942, 2 in 1943, and none thereafter.

Airships and Barrage Balloons

Production

"Production" is defined as acceptance of an airship or a balloon delivered to the procurement agency.

Aircraft Engines and Aircraft Propellers

Deliveries

"Delivery" is defined as shipment from the factory control area. The data include: engines and propellers intended for installation in newly produced airplanes, special purpose aircraft, and airships; spare engines and propellers; engines and propellers produced for export. Data on aircraft-type engines manufactured for use in tanks are excluded. Data on experimental engines and propellers are included; also included are some commercial engines and propellers for the years 1940 and 1941.

GLOSSARY OF ABBREVIATIONS
AIRCRAFT

Airplanes

Army Air Forces Symbols (Prefix) [a]

A	- Attack or Light Bomber
AT	- Advanced Trainer
B	- Bomber (Medium and Heavy)
BG	- Bomb Glider
BQ	- Controllable Bomb (Ground-launched)
BT	- Basic Trainer
C	- Transport (Cargo and Personnel)
CG	- Troop Glider
CQ	- Target Control
F	- Photographic Reconnaissance
FG	- Fuel Glider
L	- Liaison
O	- Observation
OA	- Observation Amphibian
P	- Fighter (2 & 1-engine)
PG	- Power Glider
PQ	- Aerial Target
PT	- Primary Trainer
R	- Restricted - No longer entirely suitable for combat
R	- Rotary Wing
TG	- Training Glider
UC	- Utility - Not over 5-place transport
X	- Experimental
Y	- Service Test
Z	- Obsolete (on experimental models, the prefix "X" is retained)

Navy Bureau of Aeronautics Symbols (Prefix)

A	- Ambulance
B	- Bomber
BT	- Bomber-Torpedo
F	- Fighter (2 and 1-engine)
G	- Transport (1-engine)
HN	- Training Helicopter
HO	- Observation Helicopter
HR	- Transport Helicopter
J	- Utility
JR	- Utility Transport
LB	- Special Purpose Glider
LN	- Glider-Trainer
LR	- Glider-Transport
N	- Trainer
O	- Observation
OS	- Observation Scout
P	- Patrol
PB	- Patrol Bomber
R	- Transport (Multi-engine)
S	- Scout
SB	- Scout (Dive) Bomber
SN	- Scout Trainer
SO	- Scout Observation
TB	- Torpedo Bomber
TD	- Navy Drone
X	- Experimental

Navy Symbols for Manufacturers [b] (Last Letter)

A	- Brewster
B	- Beech, Boeing, and Budd
C	- Curtiss, Cessna, Culver
D	- Douglas, McDonnell
E	- Edo, Piper
F	- Grumman, Fairchild (Canada) and Columbia
G	- Goodyear
H	- Howard
J	- North American
K	- Fleetwings (Kaiser Car Co.), Fairchild (U.S.A.)
L	- Bell
M	- Martin and General Motors (Eastern Div.)
N	- Naval Aircraft
O	- Lockheed "B"
P	- Spartan
R	- Ryan, Interstate, American Aviation
S	- Boeing, Wichita; Sikorsky (United Aircraft)
T	- Timm
U	- Chance Vought (United Aircraft)
V	- Vultee, Vickers (Canada) and Lockheed "A"
W	- Canadian Car and Foundry, Waco
Y	- Consolidated Vultee

Other Designations [c]

LB	- Liberator
NA	- North American
GR	- General Reconnaissance
DC	- Douglas Commercial
N3PB	- Northrop Patrol Bomber

Airships

ZN	- Airship
N	- Training
P	- Patrol

Aircraft Engines [d] (Prefix)

I	- Inline and Jet Propulsion
O	- Opposed
R	- Radial
V	- Vee-type
IV	- Inverted Vee-type

Aircraft Propellers

Curtiss System (e.g., C-5325-D)

C	- Curtiss
5	- Engine Shaft Size
3	- Number of Blades (3)
2 5	- Blade Shank Size (Read as 2.5)
S	- Steel
D	- Dural
H	- Hollow Hub

Aeroproducts System (e.g., A-632-SA)

A	- Aeroproducts
6	- Engine Shaft Size
3	- Number of Blades (3)
2	- Blade Shank Size
S	- Steel
A	- 1st Revision

Hamilton Standard System (e.g., 12B20) (Hydraulic)

1	- First Revision
2	- Number of Blades (2)
B	- Blade Shank Size
20	- Engine Shaft Size

Hamilton Standard System (e.g., 4260) (Super Hydromatic)

4	- Number of Blades (4)
2	- Blade Shank Size
60	- Engine Shaft Size

[a] Modifications in armor, radio, instruments, etc., are shown with an alphabetical suffix (i.e., B-17D, B-17E, etc.).

[b] In Navy designations, the numerals indicate the order of a new model constructed (e.g., PBY is first patrol bomber built by Consolidated; PB2Y is second patrol bomber model of that manufacturer to be adopted by the Navy). Modifications in armament, radio, instruments, etc., are shown by numerals following the dash (e.g., PBY-2).

[c] All other designations not covered are either commercial or foreign and are arrived at individually, often by the producer.

[d] The numbers following the letter denote the piston displacement in cubic inches of an engine (i.e., R-2800 is a radial engine having a piston displacement of 2800 cubic inches).

Source of Data - U.S. Navy Department (Bureau of Ships) and U.S. Maritime Commission.

[a] 19 vessels in 1944 and 32 in 1945 are for the Army; all others are for the Navy.

[b] Including conversions shown in parentheses adjacent to figures for total deliveries.

[c] 2 of these vessels are counted by the Navy as APA constructions, and are included in the Navy data on page 110.

[a] These are reclassifications from incomplete destroyer escorts. Light displacement tonnage is shown; standard displacement for these ships is 1,400 each.
[b] 7 ships in 1943 and 6 in 1944 were delivered to the British; all others were delivered to the U. S. Navy.
[c] Including conversions shown in parentheses adjacent to figures for total deliveries.
[d] The 2 constructions (8,722 displacement tons) delivered by the Maritime Commission as transports, AP, are included in Maritime columns on page 109.

Source of Data - U. S. Navy Department (Bureau of Ships).

[a] Excluding 37 ARL, 12 APB, and 7 AGP vessels; these vessels were reclassified from landing ships, tank (LST), and are counted as LST constructions by the Navy.

[b] Including conversions shown in parentheses adjacent to figures for total deliveries.

[c] Excluding conversions.

[d] The vessel delivered in December 1941 was a catapult lighter of 2,275 displacement tons.

[e] This vessel was constructed by the Maritime Commission and is included in the total Maritime constructions.

Source of Data - U. S. Maritime Commission.

a These vessels, converted for military use, are included in the totals for their respective types shown on preceding pages. The delivery dates for the vessels are dates of completion at the building yards. These vessels were acquired by the armed forces (Navy, Army, British) either at the time of delivery or at a later date.

b Including vessels delivered to the armed forces after assignment to the War Shipping Administration.

Source of Data - U. S. War Department (Transportation Corps.)

[a] The information shown on this page is all that is available at this time on Army-procured vessels. The Army Transportation Corps procured other types of vessels, including freight and passenger vessels, marine tractors, launches, cargo lighters, standard rescue boats, harbor defense vessels, and combat training vessels, but no reliable data are available on the number of such vessels or the dates of their deliveries; see Explanatory Notes.

[b] Including all nonpropelled and self-propelled barges, dry or liquid cargo, including tankers.

EXPLANATORY NOTES
SHIPS

Source of Data

Indicated at the beginning of each major section at the bottom of the page.

Coverage of Data

The data shown in this section of OMPUS includes all deliveries of ships by the shipyards to the Government agencies primarily responsible for constructing vessels. Some miscellaneous ship construction such as that for the Office of Defense Transportation and for the Army, is excluded herein. By agency, the coverage is as follows:

Navy Vessels

The Navy program reported herein comprises all ships completed under Navy cognizance (except Navy small boats), including the small amount of construction by the Bureau of Yards and Docks, as well as the number of conversions for each type of vessel.

Maritime Commission Vessels

The entire construction program of the Maritime Commission consisting of Military and Nonmilitary types is covered herein.

Nature of Data

Deliveries or acceptances of vessels. For Navy ships, the deliveries of vessels may be either Navy conversions of Navy completions of constructions. Deliveries of Maritime vessels represent completion of constructions.

Stage of Vessel Construction at Delivery

For new constructions, the following applies by type of ship:

Naval Vessels

For ships built in private yards, construction on the vessels delivered was 100 percent complete, with only fitting-out work remaining to be done on the ships prior to their joining the fleet. The vessels, after delivery at a private yard, came under the cognizance of the Bureau of Ships for fitting-out, either at the private yard or at a Navy yard. This work involved placing of guns, armor, communication equipment, and antisubmarine devices, trial runs, and the making of all necessary adjustments. The fitting-out time ranged from a few days after delivery for some vessels to as much as six months for battleships. For Navy yards, the stage of completion of the ships was equivalent to that of the private yards.

Maritime Commission Vessels

Deliveries fell into three groups: (1) Vessels which were completed except for some minor components which were to be supplied later. (2) Vessels transferred to the Navy or other Agencies. Certain Maritime Commission contracts called for only partial completion of ships at delivery. (3) Vessels with construction 100 percent complete and all equipment to be installed by the Commission on board ship. The procedure for the installation of guns and other defense features varied. In some yards they were installed prior to completion; in other yards they were installed after delivery.

Ship Program Classification

The groupings of vessel programs are in accordance with the standard classification established for munitions by the Bureau of Program and Statistics of the War Production Board, as of November 15, 1943. Standard classifications of vessels by the Navy Department and the Maritime Commission differed somewhat from those in this volume.

Tonnage Units

For all combatants except Maritime CVE's, the displacement tonnages are actual standard displacement. For all other naval vessels and Maritime CVE's, the displacement tonnages are actual light displacement. In the Cargo and Supply section the deadweight and gross tonnages for naval vessels are estimated.

For Maritime vessels, gross and deadweight tonnages are actual; displacement tonnages are estimates.

Displacement tonnages of conversions included in the unduplicated totals are estimated. Except for those columns in which unduplicated totals are shown, tonnage data are

shown only for new constructions.

"Standard displacement" of a surface vessel is the displacement of the vessel fully manned, engined, and equipped ready for sea, including all armament and ammunition, provisions and fresh water for crew, miscellaneous stores and all implements intended to be carried in war, but without fuel or reserve feed water on board.

"Light displacement" is the total weight or displacement of the ship without ammunition, stores, cargo, fresh water, crew, and their effects.

"Deadweight" tonnage, the payload of a vessel, is the number of tons of 2,240 pounds each that a ship can transport of cargo, bunker fuel, water, stores, crew, and passengers. It is the difference between the number of tons of water a vessel displaces light and the number of tons it displaces after submerged to the load line (weight of a vessel including cargo, stores, water, crew, and their effects).

"Gross tonnage" is a tonnage measurement based upon the volume of the vessel. It is the total internal capacity of a vessel in cubic feet divided by 100.

Unduplicated Totals Based on Use

The total number of vessels of each major category available for use is not obtainable from the addition of new constructions by agencies, nor by the addition of constructions and conversions; most of the conversions shown in the Navy columns are also included as new constructions in the Maritime columns, since the Maritime Commission actually constructed these vessels. Thus, for an unduplicated total for each major category of the ship program, the double counting between Navy conversions and Maritime constructions reported by the two agencies must be eliminated.

For inclusion in the unduplicated total, vessels were counted only once under the category of their use. In accordance with this rule for counting, merchant-type vessels converted by the Navy into military vessels were included only once under the type to which converted. A Maritime standard cargo vessel converted into a transport is counted once as a transport and eliminated from the "Unduplicated Total for Use" under "All Dry Cargo." Thus, the "unduplicated total" for any one category may be less than the total of new constructions for that type, since the ships are counted on a use basis under a different category; i.e., these vessels were converted for use as a different type.

Conversions

The Navy counted as conversions (1) all vessels acquired from private sources and converted into naval vessels, and (2) all vessels acquired from the Maritime Commission. In most instances, the Navy completion dates for Maritime-constructed vessels coincided with the Maritime delivery dates; some of the vessels, however, were completed by the Navy after Maritime delivery.

Beginning with the regular July 1945 issue of OMPUS, there were eliminated from the Navy conversion program 321 vessels acquired in 1944 or earlier by the Navy and on which no work was done. These are no longer considered conversions and are excluded from this review.

The Maritime vessels counted as conversions were completed by the yards as either military types or as nonmilitary types. For example, in the case of Navy transport conversions some of the vessels were completed by the Maritime yards as transports. In other cases, the vessels were completed as merchant types. Thus, any totals of the number of transports including both Navy and Maritime programs involve duplication. When the double-counting is eliminated, the net number of transports available for the war effort is obtained and is shown as the "unduplicated total."

Conversions acquired by the Navy from Maritime constructions of the same type of ship are segregated on the summary pages. (For example, the number of Navy transport conversions acquired from Maritime constructions of transports is given). The remainder for each category is composed of vessels from private sources and Maritime merchant-type constructions.

Military and Nonmilitary Maritime Constructions

A large part of the Maritime constructions went to the Military. Some of the vessels were constructed and delivered to the Armed Forces as military types—such as the carrier escorts, frigates, transports, and military-type tankers. Others were constructed and delivered as nonmilitary-type vessels and were acquired by direct purchase, transfer, or bareboat charter by the Armed Forces which converted the vessels for military use. The vessels were acquired either at the time of construction or at a later date. The Military's acquisitions of the merchant-type vessels are shown by major category in the summary tables. The totals for all of these acquisitions are given in the Maritime Commission summary on page 95.

In all tables, the acquisitions, regardless of when acquired are counted in the month when the vessels were completed at the building yards.

Vessels Not Shown

Maritime totals include two derrick barges (S1-BG1)—one delivered in November 1944, and one delivered in January 1945—not shown elsewhere in this report.

Army Vessels

Beginning with the regular October 1944 issue of OMPUS, Army vessels were no longer reported, because the detailed data by type were no longer shown in the reports received from the War Department. All Army vessels are excluded from the summary columns of this report, although some information on Army tugs and barges has been obtained and is shown in Table II, page 132.

GLOSSARY OF ABBREVIATIONS
SHIPS

ACM	- Auxiliary Minelayer
AD	- Destroyer Tender
AE	- Ammunition Ship
AF	- Store Ship
AG	- Miscellaneous Auxiliary
AGC	- Amphibious Force Flagship
AGP	- Auxiliary Motor Torpedo Boat Tender
AGS	- Surveying Ship
AH	- Hospital Ship
AK	- Cargo Ship
AKA	- Auxiliary Cargo Ship, Attack
AKN	- Net Cargo Ship
AKS	- General Stores Issue Ship
AM	- Large Minesweeper
AMb	- Base Minesweeper
AMc	- Coastal Minesweeper
AN	- Net Layer
AO	- Oiler
AOG	- Gasoline Tanker
AP	- Transport
APA	- Auxiliary Transport, Attack
APC	- Coastal Transport
APB	- Barrack Ship (Self-Propelled)
APD	- Troop Transport (Converted DD)
APH	- Transport for Wounded
APL	- Barrack Ship (Non-Self-Propelled)
APV	- Aircraft Transport
AR	- Repair Ship
ARB	- Auxiliary Repair Ship, Battle Damage
ARG	- Internal Combustion Engine Tender
ARH	- Heavy Hull Repair Ship
ARL	- Auxiliary Repair Ship, Landing Craft
ARS	- Salvage Vessel
ARS (D)	- Salvage Lifting Vessel
ARS (T)	- Salvage Craft Tender
ARV	- Aircraft Repair Ships
ARV (A)	- Aircraft Repair Ships (Aircraft)
ARV (E)	- Aircraft Repair Ships (Engine)
AS	- Submarine Tender
ASR	- Submarine Rescue Vessel
ATA	- Ocean Tug, Auxiliary
ATF	- Ocean Tug, Fleet
ATO	- Ocean Tug
ATR	- Rescue Tug
AV	- Seaplane Tender (Large)
AVP	- Seaplane Tender (Small)
AW	- Distilling Ship
BAK	- Cargo Ship (British)
BAM	- Large Minesweeper (British)
BARS	- Salvage Vessel (British)
BB	- Battleship
BCVE	- Aircraft Carrier, Escort (British)
BDE	- Destroyer Escort Vessel (British)
BPT	- Motor Torpedo Boat (British)
BYMS	- Motor Minesweeper (British)
BYT	- Harbor Tug (British)
CA	- Heavy Cruiser
CB	- Large Cruiser
CL	- Light Cruiser
CM	- Mine Layer
CMc	- Coastal Mine Layer
CV	- Aircraft Carrier
CVL	- Aircraft Carrier, Small
CVE	- Aircraft Carrier, Escort (formerly Auxiliary Aircraft Carrier, ACV)
DD	- Destroyer
DE	- Destroyer Escort
DM	- Light Mine Layer
DWT	- Deadweight Ton
IX	- Unclassified
LCC	- Landing Craft, Control
LCI (L)	- Landing Craft, Infantry (Large)
LCM (2)	- 45' Landing Craft, Mechanized, Mk. II
LCM (3)	- 50' Landing Craft, Mechanized, Mk. III
LCM (6)	- 56' Landing Craft, Mechanized, Mk. VI
LCP (L)	- 36' Landing Craft, Personnel (Large)
LCP (R)	- 36' Landing Craft, Personnel (With Ramp)
LCS (S)	- Landing Craft, Support (Small)
LCS (L)	- Landing Craft, Support (Large)
LCT (5, 6)	- Landing Craft, Tank, Mks. V & VI
LCV	- Landing Craft, Vehicle
LCVP	- Landing Craft, Vehicle and Personnel
LSD	- Landing Ship, Dock
LSM	- Landing Ship, Medium
LSM (R)	- Landing Ship, Medium (Rocket)
LST	- Landing Ship, Tank
LSV	- Landing Ship, Vehicle
LVT	- Landing Vehicle, Tracked (Unarmored)
LVT (A)	- Landing Vehicle, Tracked (Armored)
Mk.	- Mark
PC	- 173' Submarine Chaser
PCE	- 180' Patrol Craft, Escort
PCE (R)	- 180' Patrol Craft, Escort (Rescue)
PCS	- 136' Submarine Chaser
PF	- Frigate
PG	- Gun Boat
PGM	- Motor Gun Boat
PT	- Motor Torpedo Boat
PY	- Yacht
PYc	- Coastal Yacht
PYT	- Harbor Tug (Peru)
RPT	- Motor Torpedo Boat (Russia)
S1-BG1	- Derrick Barge
S3-S2-BP1	- Cable Ship
SC	- 110' Submarine Chaser
SS	- Submarine
YMS	- Motor Minesweeper
YN	- Net Tender
YP	- District Patrol Vessel
YTB	- Harbor Tug, Big
YTL	- Harbor Tug, Little

Source of Data - U. S. War Department (Ordnance Department) and WPB (Automotive Division) for Engineer Corps, Navy, and ARCO.
Stage of Completion - Plant acceptances.

[a] Including Navy figures on acceptances which, prior to 1943 are estimates based on quarterly totals for military truck production by category as provided by the Automotive Division, WPB. Summary data by category are available for 1943, although no detail by type can be shown.

[b] Excluding Engineer Corps types prior to 1944 except the 7 1/2-ton 4x4, "Snow-go" in 1943; data are not available on any other types.

Source of Data - WPB (Automotive Division) for ARCO, Navy, and Commercial.
Stage of Completion - Plant acceptances.
a Figures on acceptances prior to 1943 are estimates based on quarterly totals for military truck production by category as provided by the Automotive Division, WPB. Summary data by category are available for 1943, although no detail by type can be shown.

EXPLANATORY NOTES
ORDNANCE AND AUTOMOTIVE VEHICLES

Source of Data

Source of data is shown at the foot of each page. All War Department data were transmitted through the Production Division, Headquarters, Army Service Forces. Navy data were transmitted through the Office of Procurement and Material. All data included in the section (except that on trucks other than Army-procured) were secured from one or more of the following sources:

United States War Department, Chemical Warfare Service
United States War Department, Corps of Engineers
United States War Department, Ordnance Department
United States War Department, Quartermaster Corps
United States War Department, Signal Corps
United States War Department, Transportation Corps
United States Navy Department, Bureau of Ordnance

Data on Navy, ARCO, and Commercial trucks were obtained from War Production Board (Automotive Division) reports showing monthly production by manufacturers.

"Procurement Agency" shown below the data columns on some pages, notably Automotive Vehicles, indicates the source of data for each item when both Army- and Navy-procured items are shown on the same page.

Army-procured Items

Description of Data

For the items included, data represent total production undertaken within the United States for the United States War Department.

Acceptances

Plant or proof acceptances as indicated in the Stage of Completion note at the foot of each page.

Accepted but not Available for Distribution

This information is shown for selected items only. Data include quantities under test, being proof-fired, accepted in manufacturers' plants but not entered on accounts, or otherwise not made available for distribution by reporting services.

Reliability of Data

After VJ-Day the Army Service Forces reviewed and revised its records of the procurement and acceptances of "end" items. This project was still incomplete at the time these data were obtained by the War Production Board. For many items the Army's records that were available at the time the present issue of OMPUS was prepared did not show procurement by months during the early war and the "defense" periods. As a consequence, in some areas the trustworthy records give less detail than was customarily shown for current data in the regular issues of OMPUS. Where it was necessary to choose between detail and reliable information, reliability was chosen. Any reader who needs more detailed records is referred to the War Department for such additional information as may be developed there in the future.

Ammunition

Short ton totals for Army ammunition are based on the weight of loaded and fuzed projectiles without cartridge cases or propelling charges.

Automotive Vehicles (Other than Armored)

In all cases in which the truck description includes a figure on tonnage, the tonnage refers to payload capacity and on over-all wheel drive, e.g., 6 x 4: the 6 indicates the number of wheels on the vehicle, regardless of double wheel, triple wheel, etc., and the 4 shows the number of wheel drives.

The following classification is used for Military Trucks (Army, Navy, and ARCO):
Heavy-Heavy - Over 2½-ton rated capacity
Light-Heavy - 2½-ton rated capacity
Medium - 1½-ton and under 2½-ton rated capacity
Light - Under 1½-ton rated capacity

The following classification is used for Commercial Trucks (On-Highway and Off-Highway):

Heavy-Heavy - Over 24,000 pounds GVW
Light-Heavy - 16,000 to 24,000 pounds GVW
Medium - 9,000 to 15,999 pounds GVW
Light - Under 9,000 pounds GVW

Trailers and Semitrailers

Trailers may be towed by any vehicle, without special towing equipment. Semitrailers must be towed by a prime mover or other towing vehicle which has special towing equipment.

Tractors

Draw-bar horsepower is a measurement, in terms of horsepower, of the maximum force exerted by a tractor, while towing an object under standard test conditions.

Coverage and Special Notes

A small number of Engineer Corps trucks produced prior to 1944 are excluded from the production shown for the Army Service Forces, as information on these was not available. Likewise, early Army data for some Ordnance Department items are also incomplete, since the Quartermaster Corps procured for the entire Army prior to 1942, and these data are inadequate.

Any discrepancies between data shown in OMPUS and data prepared by the Automotive Division of the WPB and shown in other publications are due mainly to the following differences in method of reporting:

1. Classification: The OMPUS data includes only trucks in this section, while the Automotive Division of WPB also included certain types of combat vehicles which required components similar to those used in trucks.

2. Stage of Completion: The Automotive Division of WPB reported certain special types of trucks as produced when the chassis were delivered, while the Army reports on which OMPUS data are based, reported them as produced only when installations such as cranes were completed. A similar procedure caused disparities in production reports on some passenger busses. In addition, prior to 1944, the Automotive Division data were compiled directly from manufacturers' own production reports (which are suspected of some double-counting in that some trucks reported as "produced" may later have been rejected by Army inspectors), whereas OMPUS data always were obtained directly from Army publications showing acceptances.

Navy-procured Items

Description of Data

For the items included, data represent total production undertaken within the United States for the United States Navy Department.

Acceptances

Plant or proof acceptances, or deliveries to ship's side, as indicated in the Stage of Completion note at the foot of each page.

Ammunition

Short ton totals for Navy ammunition are based on the weight of complete projectiles, loaded and fused.

United States Programs in Canada

The data on pages 256-258 cover United States War Department procurement in Canada of Ordnance and Automotive Vehicle items. These production programs are not included among the items shown in the pages preceding 256. Many of the programs cover types of items primarily for use of British or Chinese forces, later disposed of to them under Lend-Lease. All such production, except for one item, the 57-mm recoilless rifle, came to an end by the close of 1944.

Foreign Purchases

Pages 259—265 include data on purchases by foreign governments and purchasing missions of Ordnance and Automotive Vehicle items. These production programs are not included among the items shown in the pages preceding 256. Many of the programs originated in 1940 and 1941 when the United States' policy with respect to munitions for other

countries was "cash on the barrelhead"; they were important in that production for foreign orders made it possible for many manufacturers to get under way on munitions production when United States orders were still in very small volume.

The data on foreign purchases were gathered from each separate supply mission by WPB personnel.

GLOSSARY OF ABBREVIATIONS
ORDNANCE AND AUTOMOTIVE VEHICLES

AA	- Antiaircraft	HET	- High Explosive Tracer
AAC	- Antiaircraft Common	How.	- Howitzer
AC	- Aircraft	hp.	- Horsepower
A/C	- Air Cooled	HS	- Mustard Gas
AMTB	- Anti-motor Torpedo Boat	Mag.	- Magnesium

EXPLANATORY NOTES
COMMUNICATIONS AND ELECTRONIC EQUIPMENT

Source of Data

United States War Department, Signal Corps; United States Army Air Forces, Air Technical Service Command; and United States Navy Department, Bureau of Ships and Bureau of Ordnance.

Coverage of Data

The selected items of Communications and Electronic Equipment for which data are shown in this section are those considered to be of major importance during the wartime program, in terms of strategic need or volume of production. For the items included, data represent total production undertaken within the United States.

Classification of Items

For the purposes of classification Radio and Radar are treated as independent categories of equipment. From a standpoint of use or principles of operation no such firm line can be drawn between them. Radar—meaning RAdio Detection And Ranging—is by definition a special type of radio, and many components are common to equipment shown in both classes.

Acceptances

Army-procured Items

Acceptances at plants. In some cases, equipment was accepted in the form of components and later physically assembled at various depots.

Navy-procured Items

Acceptances of complete units at plants.

Ship and Ship-and-Shore

These data include land equipment for naval operations as well as shipborne equipment.

United States Programs in Canada

Included on page 312 are data on selected items of Communications and Electronic Equipment procured in Canada by the United States War Department. These production programs are not included among the items shown in the pages preceding 312.

GLOSSARY OF ABBREVIATIONS
COMMUNICATIONS AND ELECTRONIC EQUIPMENT

Army [a]

AA	- Antiaircraft
AP	- Aerial Communication Panel Set
BC	- Radio Receiver, Radio Transmitter, Control Box, etc.
BD	- Switchboard
CC	- Cable Assembly
CE	- Cable or Wire Equipment
CF	- Telephone, Telegraph Equipment
DM	- Dynamotor
EE	- Electrical Equipment
FT	- Fittings, Clamps, Mountings, etc.
G.C.I.	- Ground Control Interception
HS	- Head Set
I	- Electrical and Mechanical Instruments
IE	- Test Equipment
IFF	- Identification, Friend or Foe
M or MC	- Microphone
ME	- Maintenance Equipment
PE	- Power Units, Dynamotor Units, etc.
PU	- Power Units and Motors except Dynamotors
R	- Telephone Receiver
RA	- Rectifiers
RC	- Radio Equipment
RL	- Wire Reel Unit
SCR	- Signal Corps Radio
SCS	- Control Net System
SE	- Signal Equipment
TA	- Telephone Apparatus
TC	- Telegraph or Telephone Central Office Set
TE	- Tool Equipment and Tool Sets
TG	- Telegraph Instruments
TS	- Test and Measuring Apparatus
TSM	- Test or Tool Set Maintenance
W/	- With
W	- Wire
WC	- Submarine Cable
WD	- Wire, Cable, or Cordage, Double Conductor
WS	- Wire, Cable, or Cordage, Single Conductor

Navy [b]

B	- Recognition or IFF (Identification, Friend or Foe)
D	- Radio Direction Finding
G	- Formerly Aircraft Transmitting (now superseded by "A" Series)
J	- Listening (Receiving)
K	- Sonic Transmitting
L	- Precision Calibrating
N	- Underwater Sound Navigational Aids, (Including echo sounding)
Q	- Echo Ranging and Listening
R	- Radio Receiving
S	- Searching or Detecting (Radar)
T	- Radio Transmitting
W	- Combination Echo Ranging and Echo Sounding
Z	- Navigation and Landing, Airborne (Superseded by Model "Y" Series)
CAN	- Contractor's Designation Letters for Sangamo Electric Company

Joint Army-Navy System

Prefix AN	- Army-Navy
1st Letter	- Installation
A	- Airborne
C	- Air Transportable
G	- Ground, General Ground Use
M	- Ground, Mobile (in vehicle which has no function other than transporting equipment)
T	- Ground, Transportable
V	- Vehicular
2nd Letter	- Type of Equipment
I	- Interphone, Public Address
P	- Radar
R	- Radio
S	- Special
T	- Telephone, Wire
3rd Letter	- Purpose
A	- Auxiliary Assembly
C	- Communication (Receiving and Transmitting)
G	- Gun Directing
L	- Searchlight Control
N	- Navigational Aids
Q	- Special, Public Address
R	- Receiving
S	- Search and/or Detecting
T	- Transmitting
W	- Remote Control
X	- Identification and Recognition

[a] No official information on abbreviations preceded by manufacturer's name (such as RCA, Bendix, Hallicrafter, Collins and Pilot) is available.

[b] The letters are the first letters (except when preceded by "A") of the model designations and indicate the basic functions of the equipment. The prefix "A" indicates airborne installation. Letters following the first identify specific equipment.

EXPLANATORY NOTES
OTHER EQUIPMENT AND SUPPLIES

The Munitions category "Other Equipment and Supplies" is composed of items falling into the following subgroups: Petroleum products, machinery, railroad equipment, photographic goods, clothing, precision and scientific instruments, medical and dental equipment and supplies, and miscellaneous equipment and supplies not elsewhere classified.

This report presents a selection of important items from all groups except photographic goods and precision and scientific instruments. The coverage of the selected items varies from group to group, but an attempt has been made to present those items which were procured in considerable quantity, were high in dollar value, were consumers of critical material, or were otherwise important from a production standpoint.

Coverage of Other Equipment and Supplies items for this Special Release has been increased substantially over that of regular issues of OMPUS, with the cooperation of the War Department and the Navy Department, especially in the Clothing and the Miscellaneous Equipment and Supplies areas. The three types of subsistence rations shown on page 330 are not classified as "munitions" in the War Program Classification used as a basis for this report, although they are included in the war program as "non-munitions;" they are shown here because of the widespread interest in these specific items.

Army-procured Items

Source of Data

United States War Department, Production Division, Headquarters, Army Service Forces.

Coverage

The approximate coverage of some important groups of items presented here in relation to their total Army Service Forces programs for 1945, on a dollar basis, is as follows: Locomotives, over 95 percent; railway cars, 100 percent; cranes and shovels, 100 percent; generators, 85-90 percent; tents, over 95 percent; drugs, chemicals, and biologicals, 60 percent; clothing 45-50 percent.

Acceptances

Acceptances of locomotives are based on the date of acceptance by the U.S. Government, after all trial runs and acceptance tests for those items constructed under Transportation Corps contracts. For the Quartermaster Corps and the Engineer Corps, acceptance of goods following inspection for conformity with specifications is regarded as delivery for all items; the Engineer Corps requires, in addition, that items be completely prepared for shipment to be considered as acceptances.

Reliability of Data

After VJ-Day the Army Service Forces reviewed and revised its records of the procurement and acceptances of "end" items. This project was still incomplete at the time these data were obtained by the War Production Board. For many items the Army's records that were available at the time the present issue of OMPUS was prepared did not show procurement by months during the early war and the "defense" periods. As a consequence, in some areas the trustworthy records give less detail than was customarily shown for current data in the regular issues of OMPUS. Where it was necessary to choose between detail and reliable information, reliability was chosen. Any reader who needs more detailed records is referred to the War Department for such additional information as may be developed there in the future.

Navy- and Marine Corps-procured Items

Source of Data

United States Navy Department, Requirement Review Board.

Coverage

The Navy clothing items presented in this report represent about 90 percent of the value of all Navy-procured clothing in 1945. The Marine Corps clothing items represent about 75 percent of the value of all Marine Corps-procured clothing in 1945. Coverage of Navy-procured Construction Equipment and Miscellaneous Equipment and Supplies is about 40 percent of the total dollar value of the Advance Base Gear portion of the Bureau of Yards and Docks program.

Acceptances

Production figures on both Navy- and Marine Corps-procured items are based on date of acceptances at depots.

TEXT SUPPLEMENT

TEXT SUPPLEMENT

SPECIAL NOTE

References to "dollar value of production" of various munitions groups, as used in some of the following texts, are references to data taken from the Production Statement Special Release, *July 1, 1940—August 31, 1945, a companion volume to OMPUS, prepared by the Military Division, Program and Statistics Bureau, War Production Board. This* Special Release *was unpublished at the time this document was prepared for reproduction, although earlier documents in the* Production Statement *series are available in War Production Board files and elsewhere.*

Munitions output estimates in the Production Statement *series were designed primarily to show the volume of physical production in the United States by type of end product. Basically, the method of evaluation involves multiplying the number of units for each munitions item by its unit cost as reported by the various war agencies. These unit costs are taken as of specific dates—in this case, 1945—and the same costs for each item are used throughout the entire time series. Then the values for items are combined to make groups, the groups combined to make the munitions total.*

Since dollar weights in the series are fixed, they may differ from actual prices paid, which often varied from contract to contract, from manufacturer to manufacturer, and from one month to the next. Dollar value figures taken from the Production Statement *should not, therefore, be considered as measures of the value of output at current prices or of expenditures. Reference should be made to the* Production Statement *itself for further detailed explanation.*

AIRCRAFT

The Production Record

Aircraft production was probably the most spectacular component of the great munition production effort of the United States during World War II. From a position of relative obscurity before the war, the aircraft industry rose in terms of value of product to first place among all American industries in 1943 and 1944, accounting for more than one-fourth of all munitions production for these two years.

A total of 299,293 military airplanes and special purpose aircraft, excluding experimental aircraft, were accepted from July 1, 1940 through Autust 31, 1945. These craft were assembled by 65 plants in the United States and 7 Canadian plants which produced for the U. S. program. (The Canadian firms accounted for 5,254 airplanes.) During the same period United States plants produced 802,161 aircraft engines and 807,424 propellers. Number of planes accepted during the war program is summarized in the following table:

NUMBER OF ACCEPTANCES OF MILITARY AIRPLANES
AND SPECIAL PURPOSE AIRCRAFT
July 1, 1940—August 31, 1945

(Unit - Each)

GROUP	Total	1940 Last 6 Months	1941	1942	1943	1944	1945 First 8 Months

Special purpose aircraft	2,420	0	0	183	493	1,081	663[r]

r Revised.

In terms of numbers of planes accepted, bombers constituted about 33 percent of the 62-month program. In terms of airframe weight of complete units, however, over 62 percent of the program was made up of bombers of all types. This reflects in large measure the tremendous industrial effort devoted by the United States to the strategic bombing of Germany and Japan and territories which they held. Airframe weight of planes accepted during the war program is summarized on the following page:

AIRFRAME WEIGHT OF ACCEPTANCES OF MILITARY AIRPLANES AND SPECIAL PURPOSE AIRCRAFT
July 1, 1940—August 31, 1945

(Unit - Thousand Pounds)

GROUP	Total	1940 Last 6 Months	1941	1942	1943	1944	1945 First 8 Months
Total military airplanes and special purpose aircraft	2,509,135	13,602	81,364	275,949	654,616	962,441	521,163

Special purpose aircraft	2,452	0	0	119	428	1,320	585

In terms of airframe weight, total output was 2.51 billion pounds of complete airframes and 0.35 billion pounds of airframe spare parts. Thus the ratio of spare airframe parts to complete airframes was about 14 percent. On a "cognizance" basis, i.e., with reference to the agency having primary responsibility for design, procurement, and inspection, Army airplanes comprised 82 percent of total airframe weight produced, while Navy planes made up 18 percent. Cognizance had only partial relation to the distribution of airplanes between recipients since both Army and Navy types went to foreign recipients through both direct purchases and lend-lease, and because there was considerable procurement by Army for Navy and by Navy for Army.

In January 1940, when military airplane production in the United States was devoted principally to models ordered by England, France, and the Netherlands, only 254 units were turned out. In March 1944, after the full expansion of the industry had been effected under our defense and war programs, output hit a numerical peak of 9,113 airplanes and special purpose aircraft. The peak in terms of airframe weight of complete units was reached two months later when almost 90 million pounds were turned out. This was about 70 times the weight output of January 1940. Greatest output for any 12-month period was attained from September 1943 through August 1944, when slightly over 101,000 airplanes were accepted.

Technical Developments

Coupled with the tremendous increase in numbers of units were important changes in types produced. Airframes became larger and heavier; average airframe weight per unit increased from 5,240 lbs. in January 1940 to 11,492 lbs. in April 1945. As new and improved tactical planes were developed and as aircraft for training aviation personnel became available in adequate numbers, production emphasis shifted from trainers to tactical types, especially the heavy bombers. The shift to heavier planes meant a shifts in materials from fabric and wood to aluminum and steel. In order to power these improved, heavier airplanes, more powerful aircraft engines were developed; new models were designed, and performance was stepped up through the use of superchargers and fuel and water injection. By the end of the war, jet propulsion was getting out of the developmental into the production phase. Although the standard 3-blade propeller formed the bulk of the propeller program throughout the war, production of the 4-blade propeller became increasingly important after 1943, and considerable developmental work was done on dual, contra-rotating propellers.

The effect of design and production changes in aircraft was to step up performance so that in July 1945 General Marshall was able to report, "At the start of this war we had bombers capable of 200 miles an hour with a combat radius of 900 miles, effective operational ceilings of 24,000 feet and bomb load capacity of 6,000 pounds. Today our development of this type of aircraft has given us bombers capable of carrying 20,000 pounds to targets 1,600 miles away at speeds of 350 miles an hour and altitudes of over 35,000 feet. In 1941 our propeller-driven fighters were limited to speeds of 300 miles an hour, a range of 200 to 300 miles and effective ceilings of 20,000 feet. Today our conventional fighters have speeds of 500 miles an hour, combat ranges of 1,300 miles, and effective ceilings of 35,000 feet."

Scheduling the Program

Scheduling the gigantic and changing aircraft program was in itself a major undertaking. Ideally, the Joint Chiefs of Staff should develop broad military objectives, then ask the Services to set forth requirements in terms of types and numbers of airplanes. With a program thus in prospect, schedules for airframes, engines, propellers, components, parts, and materials then could be drawn up, giving a blueprint of timing of items, materials, and man-

power needed to accomplish production goals. The Services could then transmit these schedules to the civilian production agency, which would see that the needed items were produced in quantities and at the times necessary to meet the military requirements. Toward the end of World War II, this ideal fell only a little short of attainment, with the Aircraft Resources Control Office operating under the Joint Aircraft Committee, and mainly responsible for scheduling airframes, engines, and propellers, and the War Production Board responsible for translating these schedules into material requirements and for dividing up available supplies among claimant agencies.

The road was a long and difficult one, however, from the viewpoint of planning and scheduling as well as production itself. The first over-all plan for the industry was announced by President Roosevelt not long after the outbreak of war in Europe. This plan called for "50,000 planes a year," and helped raise our sights with respect to the sort of production program that would be required, even though it did not specify types of planes to be built. The goal was ridiculed by the Germans and viewed with considerable scepticism by most of our own production experts. An important study made in May 1940 concluded that this rate would be reached about July 1945. (Actually it was reached three years earlier.)

The first available airplane production schedules were manufacturers' estimates made on contracts which they held. These were brought together in Report "8A" of the Aircraft Production Division of the National Defense Advisory Commission late in 1940 and were also published by the Army's Materiel Command. The "8 Series" was rapidly improved to cover anticipated production of planes not yet contracted for, planes on programs still pending in Congress, and "fill-in" for capacity which would be available after completion of planned programs. Manufacturers' estimates were frequently modified to bring them into line with more normal performance. Expected production even from plants still to be built was included, making the "8 Series" a comprehensive planning schedule to which to gear component and material production. Difficulty was experienced continuously, however, in getting all persons concerned with the program to use the "8 Series" as the basis for computing requirements and making allocations.

The problem of multiplicity of schedules was probably aggravated by the objectives laid down in President Roosevelt's speech of January 3, 1942, calling for production of 60,000 airplanes in 1942 and 125,000 in 1943, with a fivefold breakdown of types of planes. It became necessary to add to the "8-I Initial" schedule a largely meaningless series of schedules ("8-I Ultimate") for which no facilities were planned and also to add in "equivalent spare parts" in order to reach the goals of 60,000 and 125,000 planes. This left a situation in which some requirements were computed on the "8-I Initial" program, others on the "8-I Ultimate" program, and others on schedules set up independently by manufacturers and procurement officers.

The presidential objectives probably had little effect on 1942 production but seem to have been instrumental in increasing 1943 output. Schedule 8-H, in use before the President's announcement, called for only 61,000 airplanes in 1943. Schedule "8-I Initial," issued after the President's announcement, called for about 88,000 units in 1943; actual acceptances were just short of 86,000.

Schedule "8-I Initial" turned out to be quite a realistic schedule when compared with actual production in 1942, 1943, and the first half of 1944. However, subsequent schedules in the "8 Series" were chronically too high, decreasing their usefulness as a plan for the industry. It became popular to apply a discount to computations of requirements based on the series, and to use other schedules in such calculations. Finally this led to a radical cut in schedules and even to a renaming of the series to the "W" or "working" schedules.

The first of the "working" schedules, W-4, was approved in June 1943. This new series attempted to bring production schedules more nearly in line with what could reasonably be expected. Although the early "working" schedules were distorted by incentive scheduling—with goals for some models deliberately set higher than expected production in order to insure availability of materials, components, and manpower in case expectations were exceeded—by the time W-8 was approved, in October 1943, both production and scheduling had definitely firmed up. The problem of multiplicity of scheduling also became less acute. Most of the large new facilities were now equipped and under way, while the older plants were at or approaching peak rates; bulk production of established models meant that new models, with their always-optimistic timing, were playing a smaller part in the over-all program; materials bottlenecks had been broken through operations of new facilities and by WPB's Controlled Materials Plan; manpower had been trained, and experience, supplementing training, permitted a predictable increase in efficiency in a given period.

By early 1944, planes were being produced in tremendous numbers and were lasting much longer than had been anticipated. Emphasis could shift from numbers to quality, and consequently both requirements and schedules began to decline. From then on, the course was one of increasing selectivity, promoting production of especially desired models, and eliminating planes that had been produced in sufficient quantities or that had been superseded by newer models.

Selected schedules, the dates of their approval, the President's program, and a comparison with actual accomplishments are shown in the table on the following page:

AIRPLANES AND SPECIAL PURPOSE AIRCRAFT:
ACTUAL ACCEPTANCES AND SELECTED SCHEDULES

a The 8-I Ultimate Objective for 1942 and 1943 is sometimes compared with the figures of 60,000 and 125,000 airplanes as set forth in President Roosevelt's speech of January 3, 1942. For this purpose inclusion of spare parts converted to equivalent airplanes would bring the total number of airplanes scheduled in 8-I to 68,166 for 1942 and 131,417 for 1943.
b Total includes actuals for first two quarters.
c Actuals are for first eight months; third quarter includes July and August only.

Production Problems

The enormous aircraft program naturally created tremendous problems. The basic problem was that of organization and control of resources. The management of each plant had to work out the best means of utilizing available facilities, equipment, and manpower. It was an even greater problem for the government agencies to allocate and channel resources to the places in which they were needed at the time that they were needed. As one bottleneck was broken, enabling the program to go ahead, another bottleneck would arise.

First of the industry-wide bottlenecks to develop was in construction of facilities and supplying of machine tools. The demands for simultaneous mushrooming of production of all munitions items meant that new facilities had to be constructed and old facilities expanded throughout the country, simultaneously.

Then, as expanded production began to get under way, came the struggle for components and for materials, especially for fabricated shapes. Actual shortages were limited to occasional deficiencies in particular items, but manufacturers and agencies were apprehensive that future needs might not be met. As new materials facilities came into production, as the Controlled Materials Plan became effective, and as aircraft schedules were pushed back and cut, the situation was relieved.

The problem was complicated by the unrealistically high labor requirements frequently stated by the manufacturers. In many cases it was necessary to cut manufacturers' estimates sharply in order to arrive at significant labor requirements for the guidance of War Manpower Commission officials and others concerned with channeling labor to the various munitions plants. In some cases there was evidence of labor hoarding by airplane plants, but this was difficult to discover, since unit labor requirements varied markedly between models produced in different plants.

By the fall of 1943 many plants, especially those on the West Coast, were short of labor and were plagued by an excessive turnover. As efficiency of workers and management increased, however, and as schedules were pushed back or cut, requirements fell much below the early estimates. Shortages of manpower became less important as a production bottleneck.

Design changes and changing military requirements were responsible for the major production line changes after early 1944. Previously, the pressure to get planes out of plants and into combat had been so great that only the most essential tactical improvements were incorporated. By 1944, however, the program had reached the point where the Services could concentrate on quality. Tactical improvements became production-line "musts." This greatly increased the production problems of manufacturers—for example, approximately 525 major engineering changes and 2,500 minor production changes were made in the Chance-Vought F4U Corsair during 1944; each of these changes created its own special headache—but the net

result was to produce better planes with a smaller time-lag between plant and front.

The Heavy Bomber Program

Special mention should be made of the standard heavy bomber (B-17 Flying Fortress and B-24 Liberator) and the long range heavy bomber (B-29 Superfortress) programs. During the period July 1940-August 1945, acceptances of standard heavy bombers totaled 30,980 units, accounting for one-seventh by unit and one-third by airframe weight of total combat aircraft production. Only the parent plants (B-17, Boeing, Seattle; B-24, Consolidated, later Consolidated-Vultee, San Diego) were in production of these planes during 1940 and 1941. In 1942, Boeing was joined in B-17 manufacture by Douglas, Long Beach, and by Lockhead " A", Burbank; Consolidated's San Diego plant was joined in B-24 production in 1942 by Consolidated, Fort Worth; by Douglas, Tulsa; and by Ford, Willow Run; and in 1943 by North American, Dallas. The following table shows the amazing production record:

THE STANDARD HEAVY BOMBER PROGRAM

MODEL AND MANUFACTURER	Month and Year of First Acceptance (Excluding Experimental)	Peak Monthly Acceptances		Cumulative Acceptances Jan. 1, 1940 through Aug. 31, 1945
		Number of Planes	Month and Year	
Total B-17's				12,692
Boeing, Seattle	January 1940	362	March 1944	6,942[a]
Douglas, Long Beach	June 1942	122	March 1945	3,000
Lockheed "A," Burbank	June 1942	108	November 1943[b]	2,750
Total B-24's (including C-87)				18,479
Consolidated-Vultee, San Diego	December 1940	270	March 1944[b]	6,724[c]
Consolidated-Vultee, Fort Worth	April 1942	230	January 1944	3,034[d]
Douglas, Tulsa	August 1942	94	February 1944	964[e]
Ford, Willow Run	September 1942	428	August 1944	6,791
North American, Dallas	March 1943	109	June 1944	966

a Including 15 units accepted January-June 1940.
b Maximum monthly rate—first month reached.
c In addition, there were acceptances of 714 PB4Y-2's and 27 RY-3's, Navy modifications of the B-24 Liberator.
d Including 882 knockdowns from Ford.
e All knockdowns from Ford.

The B-29 Superfortress was the largest plane ever to be produced in any great number up to this date. Its production proved the value of careful planning and coordination. A B-29 Manufacturers' Committee, under the chairmanship of Brigadier General Wolfe of the Army Air Forces, met daily to expedite production and to exchange technical information. Boeing, the parent company, built new facilities at Renton, Washington, and Wichita, Kansas. Bell built a new plant at Marietta, Georgia, and Martin's new Omaha plant, building the B-26 medium bomber, was converted to B-29 production. A widespread, coordinated system of subassembly and feeder plants was established, drawn chiefly from the aircraft and the automotive industries, and especially from the automobile body builders, such as Fisher Body, Briggs, and Chrysler. Top priority was given the program throughout. Proof of the value of this method is shown by the results—in the year 1943, the first year of production, 92 units were accepted; during the first eight months of 1945, acceptances amounted to 2,507 units.

Other Significant Developments

The tremendous wartime demand for aircraft was met by means of great industrial expansion and cooperative effort. Existing aircraft plants were expanded and improved; new plants were established. The covered plant area available for production and administration increased from less than 10 million square feet to 175 million square feet. Estimated gross value of facilities rose from $114 million in 1939 to $3,906 million in December 1944. There was change in the financial structure--90 percent of the new facilities, although operated by private companies, were financed by the government. There was also a change in the geographical picture--for security reasons, and to utilize available supplies of power and labor, the new plants generally were built in the Midwest and the South, rather than following the prewar pattern of concentration along the coasts.

A large segment of the automotive industry entered aircraft production; its primary contributions were aircraft engines and subassemblies for airframes; a few automotive manufacturers, such as Ford (B-24) and the Eastern Aircraft Division of General Motors (FM, TBM),

became prime plane producers. Prewar manufacturers of refrigerators and office equipment converted to production of airplane propellers and of subassemblies for airframes.

An elaborate system of Government Furnished Equipment (GFE) and Government Furnished Installations (GFI) was set up as a means of insuring effective distribution and more adequate production of special items; and GFE, other than engines and propellers, amounted to about 17 percent of the value of aircraft production in 1944.

Underlying all this expansion of airframe, engine, and propeller facilities lay a vast development of subassembly and subcontracting plants; subcontracting increased from less than 10 percent at the beginning of the plane program to about 35 percent at peak. Prime contractors let contracts for subassemblies and parts to subcontractors, who, in turn, let subcontracts to their subcontractors, and so on down the line. This complex ramification —in one instance, production was traced from final assembly down through more than twenty tiers of subcontractors—speeded output on final assembly lines and made possible production of aircraft in formerly undreamed of volume.

Employment in the aircraft industry increased from about 50,000 in 1939 to more than 2,100,000 at peak, then began to decline after November 1943. Output continued to increase, however, because productivity per worker was increasing. Management gained experience and learned how to utilize workers more effectively; workers became better trained; improved techniques and industrial "know-how" were developed. Productivity increased rapidly as methods of large-scale production were applied to aircraft production. For example, many plants installed moving assembly lines. In fact the relationship of productivity to quantity produced was consistent enough to permit the formulation of the "70 percent rule;" i.e., whenever cumulative output of a given model doubled, man-hours per unit declined 30 percent (or to 70 percent of the previous level). Some of the better plants experienced an even more rapid productivity increase but the "70 percent rule" held with sufficient consistency to make possible its use in forecasting manpower requirements when there was not too difficult a change involved in producing a new series of a given model.

There was unprecedented cooperation among manufacturers, and between industry and government. Prewar manufacturing rivals became wartime associates. Members of the West Coast and East Coast Aircraft Production Councils pooled ideas and techniques. Labor and management worked together to solve production problems. The Services, the War Production Board, and other government agencies did their utmost to facilitate production, to solve or to prevent the arising of problems, and to coordinate separate programs so as to promote the total program.

The results of this great joint enterprise are shown statistically in the data pages of this report.

NAVAL SHIPS

The Production Record

Between July 1, 1940, and August 31, 1945, the United States Navy Department constructed 8.5 million displacement tons of fighting ships. This tremendous ship construction program increased the size of our fleet from 1.9 million displacement tons at the end of 1939 to 13.8 million by August 31, 1945, and made the United States Navy greater than the combined naval fleets of the rest of the world. Of the Navy total, combatants accounted for 3.6 million tons, or 42 percent; landing vessels 3.0 million tons, or 36 percent. The remainder of the new construction program consisted of patrol and mine craft, district craft, and auxiliaries. A summary is shown in the following table:

NAVAL SHIP NEW CONSTRUCTIONS
July 1, 1940—August 31, 1945

(Unit—Thousand Displacement Tons)

GROUP	Total	1940 Last 6 Months	1941	1942	1943	1944	1945 First 8 Months
Total Naval Ships	8,454	52	218	869	2,661	3,223	1,431
Combatants (including Destroyer Escorts)	3,587	25	137	431	1,402	1,047	545
Landing Vessels	3,035	(0)	8	233	796	1,513	485
Patrol and Mine Craft	540	(0)	12	117	199	160	52
Transports	96	0	0	3	22	20	51
Auxiliaries and other	1,148	27	61	85	223	463	289
Cargo and Supply (Navy)	48	0	0	0	19	20	9

a Navy Department only; excluding small, rubber, and plastic boats.
(0) Fewer than 500 tons.

Program Since World War I

To obtain a proper perspective for examining the tremendous ship production record, it is necessary to review briefly some important events affecting the Navy Program since World War I. As a result of the Washington Arms Conference of 1922, which originated the "5-5-3" ratio for capital ships of the United States, the United Kingdom, and Japan, the United States agreed to scrap several battleships (but fortunately was allowed to reclassify the Lexington and Saratoga as aircraft carriers prior to completion as battle cruisers). The London Naval Conference of 1930 further delimited our combatant strength. During all of these years except 1924 and 1929 funds appropriated were insufficient to build the Navy up to treaty strength.

In 1933, authorizations for 2 aircraft carriers, 4 cruisers, 20 destroyers and 4 submarines were signed, and work got under way on these ships. The Vinson-Trammel Act, signed in March 1934, authorized the construction of an additional 150 thousand displacement tons of combatant vessels, but failed to carry any appropriation for such construction.

Both the Washington and London treaties carried provisions for replacing over-age, lost, or obsolescent vessels. Accordingly, in 1935, work began on the plans and designs for the battleships of the North Carolina class-35,000 standard displacement tons. These vessels, incidentally, were not delivered until after World War II had begun.

Witnessing the huge armament race then under way—in spite of the several limitation treaties—the President, in his message to Congress in early 1938, asked for a 20 percent increase in naval strength, exclusive of the replacements provided for in the Act of March 1934. The resulting Act of May 1938 (20 percent Expansion Act) carried an authorization for 295 thousand tons of combatants and 134 thousands tons of auxiliaries. Sufficient funds were also made available.

By the end of 1939, the United States Navy included more than 1,000 vessels, totaling 1.9 million displacement tons. Of this total, 68 thousand tons were produced in 1939—16 destroyers, 8 submarines, 3 cruisers, and 1 auxiliary.

In October 1939, the Congress of American Republics, meeting in Panama, had resolved upon the establishment of "a neutral zone surrounding the Americas, with the exception of Canada, at an average distance of 300 miles." The major portion of the task of antisubmarine patrol now fell to the United States.

Because of the increasingly difficult situation throughout the world, the Navy again sought increase in early 1940. The "11 percent Expansion Act" was signed on June 14, 1940, after the fall of France, and on July 19, 1940, the President signed the Two-Ocean Navy Bill, further increasing the authorized combatant strength by 1.3 million displacement tons, the greatest naval expansion ever authorized. The effect of these two acts was to earmark 1.5 million displacement tons for combatants. Thus, more than a year prior to Pearl Harbor, a substantial portion of the combatant fleet was conceived and assigned to builders. During 1940, there were completed 107 ships totaling 109 thousand tons, a 60 percent increase over 1939 constructions.

During the summer of 1940, the Battle of Britain was in its initial stages, and the German submarine campaign was being prosecuted vigorously. In view of the British need for antisubmarine patrol vessels, the United States entered into an agreement transferring 50 of our older destroyers in exchange for rights to certain naval bases in the Atlantic which were essential for our national defense.

Faced with the Lend-Lease Act which was signed on March 11, 1941, and our consequent assistance to the British in convoying materials and supplies to bases in Greenland and Iceland, the Axis began attacking and torpedoing our merchant vessels and naval vessels in convoy. During September 1941, our forces were ordered by the President to shoot on sight any vessel attempting to interfere with American shipping, or with any shipping under American escort.

During November 1941, further steps were taken to enable our naval forces to meet the steadily growing emergency. On November 1, the Coast Guard was made part of the Navy, and in the same month, several sections of the Neutrality Act were repealed, thereby permitting the arming of U. S. merchant vessels and removing almost all voyage restrictions.

The rate of ship construction continued to rise in 1941 with the delivery of 1,194 vessels, aggregating 218 thousand tons of new construction, including two 35,000-ton battleships, the "Washington" and the "North Carolina," and the aircraft carrier "Hornet." At the end of 1941 the fighting fleet totaled 2.7 million displacement tons.

Wartime Programs

The Navy wartime shipbuilding program may be classified under three main categories:

1. Regular Program

Construction of combatant ships, patrol vessels, and mine craft in the regular program proceeded throughout the war with no major obstacles. The program was fairly stable, and schedulec were generally met. From July 1, 1940, through August 31, 1945, over 2.9 million tons of combatants (excluding destroyer escorts)and 540 thousand tons of patrol vessels and mine craft were completed.

2. Auxiliaries

The Navy continually postponed auxiliary deliveries during the war to make way for more urgently needed vessels or for ship repair, although those auxiliaries which were most essential, such as tender and repair vessels, met schedule fairly well. In 1943, auxiliaries as a group fell far behind first-of-year schedule, due primarily to a shortage in components. With the bottleneck in components removed, deliveries increased steadily during 1944 and 1945.

3. Special Programs

The special programs—landing vessels and destroyer escorts—constituted the Navy's most difficult problem, in that they were to be met simultaneously with the regular program.

As early as 1936, the Navy, realizing the importance of amphibious operations in modern warfare, had been experimenting with various types of landing craft. Contracts for several types of landing craft were let in 1940 and 1941, and when war actually struck on December 7, 1941 work was in progress on five types of small landing craft. Moreover, at the request of the British, the Bureau of Ships in November 1941 had begun to develop oceangoing landing ships capable of carrying and depositing large numbers of men and heavy equipment on a beachhead. Working with British consultants, the Bureau of Ships developed the landing ship, tank (LST), and let contracts for many of these ships during the first quarter of 1942.

Contracts for the first destroyer escort were let in November 1941. In January 1942, the program was stepped up, and as Germany increased both its actual submarine construction and facilities, the Bureau of Ships increased its contracts for DE's. Because of tremendous shipping losses, DE's were accorded a higher priority than landing vessels but a lower priority than other combatants. During the first quarter of 1943, DE's were being built on a mass scale in 17 yards. It should be noted, however, that by the time DE's were being completed en masse, the allied shipping losses had already dropped substantially and the submarine menace was virtually at an end.

Early in April of 1942, the two major problems facing the Navy were (1) to prepare for the invasion of Africa, and (2) to combat the submarine menace. The first plan called for landing vessels, the second for destroyer escorts. Invasion was considered of first importance and reflected in subsequent changes in ship schedules. As of April 1, 1942, 9 thousand tons of landing vessels, and 2 destroyer escorts (2,600 tons) were to be completed in 1942, but the schedule as of July 1 called for 225 thousand tons of landing vessels and no destroyer escorts due for completion in 1942. During the last quarter of 1942, the landing vessel program was again stepped up, and 6,917 vessels totaling 233 thousand tons were delivered during the year.

The Navy schedules of August 1942 indicated that both the regular and the special program could be realized in 1942, but actual deliveries fell short in both groups. Because of delayed facility expansions and lack of experience by builders, the first landing vessel program fell about a month behind schedule, attaining its peak in February 1943, with 107 thousand tons delivered in that month.

With the completion of the first landing vessel program at the beginning of 1943, the Navy concentrated its efforts on the lagging destroyer escort program; by the end of the year, 306 vessels were completed, 16 ships over the April 1, 1943, schedule. With the growing success against the German U-boats in the Atlantic, the DE program was curtailed from 1,005 authorized vessels to 565. After June 1, 1944, an additional 56 destroyer escorts in process of construction were reclassified to high speed transports (APD); by August 31, 1945, the completed portion of the DE program amounted to 504 ships, totaling 652 thousand tons.

Towards the end of 1943, as a result of the Cairo Conference, a second and much more ambitious landing vessel program was initiated. Because contracts were awarded late and because some major changes in design for the LST were made, the program ended about 20 days behind the January 1 schedule. At the end of May 1944, just before the landing in France, military requirements were practically met or exceeded for all types of landing vessels except for the LVT, which was about 10 percent behind the first-of-year schedule. May deliveries, the peak for landing vessels, amounted to 198 thousand tons.

Ship Repair and Conversions

One would imagine that the task of augmenting the regular fleet (combatants, district, patrol and mine craft, and auxiliaries) and the building up of two new special programs—landing vessels and destroyers escorts—would have completely taxes the manpower and resources of the naval shipyards of the country. During the war period, however, the Navy also effected the conversion of 1,768 ships built mainly by the United States Maritime Commission. (A few came from private sources.) In addition, the Navy was confronted with and met the ever increasing requirements for maintenance and repair of its large fleet, as is shown in the following table:

EXPENDITURES FOR MAINTENANCE AND REPAIR
OF THE UNITED STATES NAVY FLEET

(Unit-Million Standard 1945 Munitions Dollars)

PERIOD	EXPENDITURES
1940 (Last 6 Months)	$ 104
1942	448
1934	909
1944	1,126
1945 (First 8 Months)	1,154

Size of the Fleet

These four factors: (1) the tremendous increase in size of the regular fleet; (2) the special programs for landing vessels and destroyer escorts; (3) the huge conversion program; (4) the increasing maintenance and repair program, which saved an innumerable amount of vessels, all combined to bring the United States Naval Fleet from 2.7 million tons at the time of Pearl Harbor to 13.8 million tons at the end of August 1945.

SIZE OF THE UNITED STATES NAVY

(Unit Million Displacement Tons)

DATE	DISPLACEMENT TONNAGE
December 31, 1941	2.7
December 31, 1942	3.9
December 31, 1943	6.8
December 31, 1944	11.9
August 31, 1945	13.8

MARITIME COMMISSION VESSELS

The Production Record

Under the direction of the United States Maritime Commission, this country produced from July 1, 1940, through August 31, 1945, 5,509 merchant and military-type ships, aggregating 54,065 thousand deadweight tons. Of these ships, 4,892 were merchant ships and 617 were for military use, mainly for the United States Navy. This record shipbuilding program included 16 types of vessels with 124 separate classifications and designs—mass-produced Libertys to fast cargo types, aircraft escort vessels, and oceangoing tugs.

The Merchant Marine Act of 1936

For a real understanding and appreciation of the Maritime Commission's production record the story should begin with the passing of the Merchant Marine Act by Congress in 1936. This act stimulated the nearly lost art of shipbuilding in the United States.

The preamble of this all important act read as follows:

> It is necessary for the national defense and the development of its foreign and domestic commerce that the United States shall have a merchant marine:
>
> (a) sufficient to carry its domestic waterborne commerce and a substantial portion of the waterborne export and import foreign commerce of the United States and to provide shipping service on all routes essential for maintaining the flow of such domestic and foreign waterborne commerce at all times,

(b) capable of serving as a naval and military auxiliary in time of war or national emergency,

(c) owned and operated under the United States flag by citizens of the United States insofar as may be practicable, and

(d) composed of the best-equipped, safest, and most suitable types of vessels and constructed in the United States and manned with trained and efficient citizen personnel. It is hereby declared to be the policy of the United States to foster the development and encourage the maintenance of such a merchant marine.

Accordingly, in 1937, the United States Maritime Commission initiated a shipbuilding program which provided for the construction of 500 vessels over a period of 10 years—50 per year. This program called for the gradual replacement of the fleet's over-age vessels with high-speed tankers and cargo ships. The schedule of 50 ships per year was raised to 100 in 1939 and then doubled again in 1940, to 200 vessels per year.

Development of the Wartime Program

Expansion of the war in Europe necessitated the building of cargo ships on a mass production basis, but propulsion machinery was not available on a sufficiently large scale to permit rapid construction of many standard or "C" type cargo vessels. The Maritime Commission's answer was the 10,500-ton 11-knot Liberty ship, the EC2, designed for propulsion by reciprocating steam engines with steam auxiliaries. A purely emergency vessel, it could be produced on a mass production basis in shipways designed to take advantage of large-scale prefabrication methods of hull sections.

By the end of 1940, the capacity of the shipbuilding industry had expanded to 18 yards with about 70 ways. The industry spread geographically so that by the end of 1942 there were Maritime Commission shipyards in 24 states on the Atlantic, Pacific, and Gulf Coasts, and some even on the Great Lakes.

In 1941, Maritime yards completed 103 vessels totaling 1.2 million deadweight tons, with standard cargo vessels and tankers comprising most of the total tonnage. In that year only seven Liberty vessels were completed—five for the British and two for the United States. The first Liberty keel, for the "Patrick Henry," was laid on April 30, 1941; the ship was completed eight months later. After Pearl Harbor, construction of merchant ships proceeded at a spectacular rate. The average building time for EC2's at the beginning of 1942 was 241 days; by August of the same year this was reduced to about 100 days. A record average for all yards of 39 days was reached in December 1943, and some yards were able to launch vessels in even less time than this.

As a result of the President's State of the Union Address to the Congress on January 6, 1942, and two subsequent directives, shipbuilding programs of 8.0 and 18.9 million deadweight tons were set for 1942 and 1943, respectively. To achieve these Presidental goals, shipyards facilities were expanded further, so that by June 1943, 81 shipyards with about 285 ways were in full operation. Although some other military programs were falling short of the President's goals, Maritime Commission ship deliveries in 1942 achieved a sevenfold increase over 1941 and slightly exceeded the 8.0 million ton objective. Libertys smashed through ahead of schedule with 597 vessels.

In 1943, production again exceeded the Presidential goal—this time by 2 percent; 1,949 ships, totaling 19.3 million deadweight tons, were completed—18 times 1941 production and more than twice that of 1942. This increase was due mainly to the production of Liberty vessels—1,238 ships, totaling 13.4 million deadweight tons were delivered. Tankers and standard cargo vessels also increased, but not at the astounding rate for Liberty ships. The table on the following page summarizes the Maritime Commission Ship Construction record:

MARITIME COMMISSION SHIP DELIVERIES
July 1, 1940—August 31, 1945

(Unit - Thousand Deadweight Tons)

TYPE OF VESSEL	Total	1940 Last 6 Months	1941	1942	1943	1944	1945 First 8 Months
Total Deliveries	54,065	390	1,161	8,090	19,296	16,447	8,681
Standard dry cargo	4,818	185	572	444	1,519	1,209	889
Emergency dry cargo	33,157	0	72	6,402	13,361	8,927	4,395
Liberty vessels	29,044	0	72	6,402	13,361	7,798	1,411
Victory vessels	4,113	0	0	0	0	1,129	2,984
Other dry cargo (excl. Military types)	1,478	52	96	89	124	392	725
Tankers (excl. Military types)	10,907	153	421	999	3,481	3,739	2,114
Military types	2,878	0	0	63	330	1,928	557
Transport attack, APA	946	0	0	0	44	775	127
Cargo attack, AKA	498	0	0	0	0	355	143
Other military	1,434	0	0	63	286	798	287
Other types	827	0	0	93	481	252	1

With the decline of the submarine menace and the attainment of a sizeable fleet of merchant vessels, the 1944 and 1945 programs shifted from Libertys to the fast "C" type standard cargo and Victory ships—better suited than Liberty ships for the long Pacific runs, as well as for postwar trade. Victory ships were equipped with turbine engines capable of producing at least 6,000 horsepower and top speed of about 15 to 17 knots, nearly 50 percent faster than the EC2.

Special Programs

The United States Maritime Commission, in addition to developing its own vast merchant ship construction program, was called upon in 1942 to help combat the submarine menace by building aircraft escort vessels and corvettes (frigates) for the Navy. This program was slow in getting into high gear. In November 1942, 280 thousand deadweight tons of convoy vessels were scheduled for 1943; in March 1943, the total for the year was reduced to 260 thousand tons. Actual deliveries amounted to 85 thousand tons. All 50 of the 6,730-displacement ton aircraft escort vessels built by the Maritime Commission were delivered between July 1943 and July 1944. In 1944, these CVE's were delivered at the rate of about five per month. Frigate deliveries (96 in number) progressed slowly. The last three were delivered in October 1944.

The schedules for 1944 and 1945 included a large program of military-type ships (cargo attack, AKA; and transport attack, APA) for the armed forces, primarily for use in the Pacific theatre. Most of these "combat loaders" were scheduled for delivery in the latter part of 1944 in West Coast yards which had completed their contracts for Liberty ships. Partly due to the labor shortages, however, the combat loader program lagged behind schedule from the start.

Size of the United States Merchant Fleet

In spite of the large number of sinkings, the United States controlled merchant fleet increased from 11.4 million deadweight tons in 1940 to 45.0 million tons in July 1945—about one-half of the world's merchant fleet at that time. The following table shows the growth as measured at various dates:

MERCHANT FLEET OF OCEANGOING VESSELS CONTROLLED BY THE UNITED STATES
(Vessels 1,600 Gross Tons and Over)

(Unit - Million Displacement Tons)

DATE	DEADWEIGHT TONNAGE
July 1, 1940	11.4
January 1, 1942	11.6
January 1, 1943	16.0
January 1, 1944	29.3
July 1, 1944	35.0
January 1, 1945	39.0
July 1, 1945	45.0

ARMY GUNS AND FIRE CONTROL

The Production Record

Peak production value of Army guns and fire control equipment was reached in the last quarter of 1943, after a steep rise from the very low levels of 1940 and 1941. By the end of 1943, the Army had about reached its maximum size and had most of its initial equipment. Production of guns and fire control items was therefore allowed to decline gradually in 1944 and 1945, and during the first eight months of 1945 monthly value of output was about half that of the peak year 1943.

ARMY GUNS AND FIRE CONTROL EQUIPMENT PRODUCTION
Total, and Selected Groups, July 1, 1940—August 31, 1945

(Unit - Each)

GROUP	Total	1940 Last 6 Months	1941	1942	1943	1944	1945 First 8 Months
Total Army-procured guns and fire control equipment (Million dollars)[a]	5,410	12	158	1,111	2,032	1,431	666
Heavy field artillery (complete equipments)	7,803	3	62	647	2,660	3,284	1,147
Spare cannon for heavy field artillery	8,436	0	0	0	323	3,601	4,512
Spare recoil mechanisms for heavy field artillery	4,046	0	0	0	120	2,035	1,891
Light field and antitank guns	56,189	650	4,055	20,536	18,696	7,685	4,567
Tank guns and howitzers	116,754	491	6,296	43,368	34,711	19,991	11,897
Self-propelled guns and howitzers	27,242	0	0	8,811	13,155	2,981	2,295
Aircraft guns	156,587	0	1,785	68,114	78,132	7,556	1,000
Antiaircraft guns	49,909	170	639	14,509	24,159	9,636	796
Antiaircraft gun directors	37,859	17	101	8,998	25,824	2,909	10
Mortars	111,246	1,173	8,345	10,983	25,781	24,842	40,122
Heavy machine guns	1,963,525	3,919	53,644	347,492	641,638	677,011	239,821
Light machine guns	717,527	1,937	27,672	314,839	188,331	121,771	62,977
Rifles (excluding carbines)	6,529,859	57,203	298,293	1,425,926	2,723,696	1,400,608	624,133
Carbines	6,117,847	0	5	115,813	2,959,336	2,088,697	953,996

a Standard (1945) munitions dollars.

Pre-Pearl Harbor

Pre-Pearl Harbor production of Army guns and fire control equipment was almost insignificant, in terms of numbers of items, as may be seen from an examination of some of the figures. In the 18 months prior to January 1942, the United States Army received only 65 heavy field pieces, compared with a total of 3,284 turned out in 1944. Less than 5,000 light field and antitank pieces were produced in this 18-month period, compared with over 20,000 turned out in 1942. Only 118 antiaircraft gun directors were accepted between July 1, 1940, and December 31, 1941, compared with a figure of 25,824 in 1943. Many programs, such as those for self-propelled weapons and carbines, had yet to get under way.

Early Difficulties

In view of the tremendous requirements for initial equipment of our rapidly growing Army, effort in 1942 was devoted mainly to those types of guns which lent themselves to mass production at the time, rather than to improved types for which development was not then sufficiently advanced for quantity production. Inasmuch as the types and numbers of gun-producing facilities were much more limited in 1942 than later, it was impossible to carry on simultaneous production and development programs with any hope of achieving substantial returns in both. At that time, it was a choice either of equipping the steadily expanding Army with readily available guns, or of deferring equipment of that Army until some indefinite future date when experimental weapons could be standardized and produced in great quantities.

This choice was resolved by the fact that battle had already been joined in many parts of the world by the United States and Allied Armies; consequently, the need for guns was so great that full production was ordered on all guns which could be manufactured rapidly and delivered to activated forces. As a result, 1942 was a banner year in the production of light caliber weapons; the heavier caliber guns were still in the developmental stage or could not be turned out in quantities. This fact is especially apparent in the field artillery group, in which output of heavy guns (4.5-inch through 240-mm) amounted to only 647 units in 1942, but rose to 3,284 in 1944, while the lighter guns in this group (37-mm through 105-mm) declined from their peak of 20,536 units in 1942 to 7,685 in 1944, and to 4,567 in the first eight months

of 1945. A similar development took place in tank armament. In 1942, the only tank weapons in substantial production during this peak year for tank guns and howitzers were the 37-mm and the 75-mm guns. By the end of 1944, however, production on both the 37-mm and the 75-mm tank guns had dropped 83 percent from 1942 levels. The much more effective 76-mm gun, the 90-mm gun, and the 105-mm howitzer came into production (other than experimental) as tank weapons only after 1942, and became the mainstay of the tank armament program by the spring and summer of 1945.

Production at the Peak

Production of most types of Army guns and related equipment reached a level in 1943 which was not equaled later. The few groups which did not reach their peaks until 1944 include heavy field artillery, rocket launchers, flame throwers, 4.2-inch chemical mortars, and the programs for remanufactured and reconditioned guns.

The production objective in 1943 was to equip our Army of 6.7 million men, stockpile sufficient reserves, and ship substantial quantities of guns and auxiliary equipment to member nations of the anti-Axis coalition. This was an ambitious program, and it was realized only by increasing production 83 percent in value over that of 1942.

New Production Patterns

Not only was there a great increase in production in 1943—there was also a tremendous increase in the selectivity in production of guns and equipment. Thus, although the peak for total Army guns and fire control equipment was reached in November 1943, there were actual declines as early as January in .30 caliber machine guns, light antiaircraft guns, most self-propelled guns, and in all tank guns smaller than 76-mm.

New weapons produced for the first time in 1943 included the 76-mm tank gun (except some experimental production in 1942), the 90-mm tank gun, and the 105-mm tank howitzer. Guns for self-propelled carriages were augmented in the second half of the year by the addition of the 76-mm gun, and for the first time airplanes were equipped with 75-mm guns and 4.5-inch rocket launchers. Although the antiaircraft program began to decline in 1943, production of 400 of the 4.7-inch AA guns that year gave greater range to our antiaircraft fire power and provided better protection against high-flying enemy bombers.

By 1944, production programs evidenced an almost complete reversal of the 1942 trends and goals; the type and number of guns produced were based on tactical desirability rather than on expediency, as was the case in 1942. By the end of 1943, the Army had approached its maximum size and was almost completely equipped; thus the production problem was largely one of maintenance and replacement with improved types rather than one of furnishing initial equipment.

The selective production patterns started in 1943 were continued with greater emphasis through 1944 and the first eight months of 1945. The most marked of these trends was registered in the antiaircraft gun and fire control groups, in which decline started about the middle of 1943 and continued through 1944 and 1945. This shift—brought about by the change in Allied tactics from defensive to offensive warfare--was responsible for a drop in monthly output of antiaircraft guns from the January 1943 peak of 2,719 units to 350 units in December 1944; none were produced after April 1945. Similarly, production of antiaircraft gun directors fell from a peak rate of 2,403 in May 1943 to 28 in December 1944, and to only 10 units during the entire first eight months of 1945.

The Heavy Artillery Program

The other significant trend in the gun and fire control program after 1942 was the steady increase in the production of heavy field artillery (and related spare equipment). Production in this group rose from a level of 116 guns in the first month of 1943 to a peak level of 326 guns in November 1944, while spare cannon for heavy artillery increased from a monthly average of 23 units during the first half of 1943 to 405 in December 1944, and to a peak of 879 units in April 1945.

By the end of the first quarter of 1944, the Italian Campaign had demonstrated that more intensive and sustained heavy artillery barrages were desirable. As a result, production of heavy artillery was stepped up so that by the end of the year 3,284 pieces had been produced, compared with the previous year's total of 2,660 heavy field weapons. The higher rate of artillery fire in the mounting offensive also increased the attrition rates of spare cannon and recoil mechanisms for both heavy and light field artillery. This led to a rise in production of spare cannon for heavy field artillery from 323 in 1943, to 3,601 in 1944, and to 4,512 for the first eight months of 1945, while spare tubes for all other artillery rose from 6,488 in 1943, to 9,575 in 1944, and 8,863 for the last eight months of the war. Similarly, production of spare recoil mechanisms for all types of artillery jumped from 1,401 units in 1943, to 5,031 in 1944, and reached a wartime peak of 5,911 in the period January-August 1945.

Developments in 1945

At the end of 1944, production on 1945 critical programs (heavy artillery, mortars, heavy tank guns, and self-propelled weapons) was scheduled at the peak rates of production reached during the last quarter of 1944, or, as in the case of 60-mm mortars, was scheduled to

exceed those rates. At the time, there was doubt whether these levels of production could be met because of lack of sufficient labor and facilities. As V-E Day approached, however, drastic program cutbacks were instituted to reduce munitions production from a two-front to a one-front war level. It was soon evident that all production objectives at the reduced levels could be reached with available facilities and manpower. By July 1, 1945, the guns and fire control category had been [redacted]ed to a one-front basis; and total production objectives had been cut back 35 percent from March 1 levels, the last month that schedules were on a two-front basis.

Total guns and fire control production during the first eight months of 1945, while on a much lower level in most categories than in 1944, did exceed 1944 production in several subgroups. Spare cannon for heavy field artillery and spare recoil mechanisms for both heavy and light artillery were turned out at record rates. The growing emphasis on war in the Pacific also led to accelerated production of light weapons (such as the 60-mm mortar) suitable for use in the jungle, and to the development of new recoilless weapons—the 4.2-inch recoilless mortar, and the 57-mm and 75-mm recoilless rifles. Terrain covered in the Pacific land fighting was inaccessible to tanks and heavy artillery but not to foot soldiers. To give the foot soldier greater fire power, recoilless weapons were designed to eliminate the kick-back action resulting from the expanding propellant gases. These weapons could, therefore, be used without carriages or recoil mechanisms. During 1945, production of the 4.2-inch recoilless mortar rose from 4 in January to 47 in August, while production of the 75-mm rifle increased from 37 in February to 306 in June. Output of the 57-mm recoilless rifle (one of the United States programs in Canada) rose from 20 in April to 249 in August.

ARMY AMMUNITION AND BOMBS

The Production Record

The production record for Army-procured ammunition and aircraft bombs was one of the major miracles of the entire war program. From a mere trickle of $11 million (measured in standard 1945 dollars) produced during the last six months of 1940, and $145 million in 1941, Army ammunition and bomb production grew to $4,193 million in 1944, the last full year of production, and in the peak month of April 1945 had reached an annual rate of $5,748 million. The growth of the whole program and various important segments is shown in the following tables:

ARMY AMMUNITION AND BOMB PRODUCTION
Total, and Selected Groups, July 1, 1940—August 31, 1945

GROUP	Unit	Total	1940 Last 6 Months	1941	1942	1943	1944	1945 First 8 Months
Total Army-procured ammunition and bombs	Million dol.[a]	13,489	11	145	2,173	3,813	4,193	3,154

Aircraft bombs (Army)	Thousand short tons	3	32	97	159	206	242

a Standard (1945) munitions dollars.
(0) Less than 500 short tons.

Beginnings of the War Program

At the start of the war program, the Army had too little of practically all types of ammunition and needs were out of all proportion to immediate production possibilities. Facilities for production on the scale required were entirely inadequate, and had to be expanded rapidly at first. In July 1942, for example, the War Department had more than 80 separate explosives, ammunition, or loading plants under construction. Prior to completion of adequate facilities, production emphasis shifted about from one "emergency" program to another in response to special requests from field commanders, and scant attention was paid to any over-all objectives or to balanced programming of production. Schedules of output even for the current month were often far out of line, and were especially so when newly constructed facilities failed to get under way on time, or when technical difficulties or manpower shortages developed. Despite such difficulties, however, production increases were fantastic for almost all types of ammunition during the first 18 months of the war.

Production Levels Off

By mid-1943, pipelines from loading plants to battlefields were filled, reserves began to accumulate, and the period of production for quantity's sake came to an end. For the remainder of the war, production schedules and goals for both ground army ammunition and aircraft bombs were determined largely by strategic needs and progress of the Allied offensive.

Output of many types of Army ammunition actually leveled or fell off during 1943 and early 1944, as reserves were built up or as requirements were lowered in certain areas: (a) Reduced and more realistic objectives for aircraft production brought about substantially smaller requirements for aircraft ammunition; (b) accumulation of large reserves of small arms ammunition permitted a considerable slackening in this program by the end of 1943; (c) antiaircraft gun ammunition reached its peak in the fourth quarter of the year, then fell off sharply beginning in February 1944, as Allied offensive tactics and increasing air superiority lessened the need for this type of ammunition; and (d) stocks of heavy artillery shells were built up during 1943, and schedules cut back sharply, in line with current expenditure rates in the field.

Aircraft Bombs

Production of aircraft bombs increased sharply and quite steadily from the almost minute levels of 1940 and 1941. By the end of 1943, there were 628,000 tons of bombs in storage—about five months' output at 1943 rates, and an increase of 700 percent in storage during the year; 75 percent of the bombs in storage were General Purpose and Demolition types, so with an apparent oversupply in stock, production of GP bombs was slowed up, and the 100-pound and 250-pound types were even taken out of production for several month early in 1944.

Increasing Requirements to the End of the War

Developments in the Italian compaign rudely shattered any plans for slowing down permanently the production of heavy artillery ammunition. These factors—the enormous expenditures of ammunition in Europe, lengthened estimates of the duration of the war in Europe, and larger estimates of requirements for the Japanese war—all influenced, and tended to raise the ammunition (and bomb) programs from early 1944 until the time that VE-Day was obviously at hand. In the short space of only two months, from February (as shown in the Army Supply Program) to April 1944, 1944—1945 requirements for shells over 105-mm were raised 60 percent, from $780 million to $1,250 million.

Large-scale saturation bombing and the extensive support to ground troops (with light bombs) by United States airplanes, during the first part of 1944, reversed the trend of aircraft bomb storage. Between January 1 and June 1, 1944, storage of 100-pound GP bombs decreased 81 percent, and storage of 250-pound GP's decreased 47 percent. The issuance rate for GP bombs as a whole tripled between January and May. As a result, strategic requirements for bombs were increased sharply.

Problems involved in attaining the new higher rates of production for artillery ammunition far beyond any attained up to that time included: (a) Construction of new facilities; (b) securing new machine tools; (c) obtaining manpower. Of these problems, the most difficult was obtaining machine tools.

Despite these and other problems, however, artillery ammunition production continued to rise as the program was set at higher and higher levels, until the second quarter of 1945. By December 1944, actual production had reached an annual rate of $2,100 million, with scheduled production aimed at an annual rate of $4,400 million. In April 1945, production of artillery ammunition reached an all-time monthly high of $266 million, an annual rate of $3,192 million.

Bomb requirements were based primarily on the Army Air Force's bomb-dropping capacity. As this capacity increased with the development of our offensive, requirements continued to rise and production schedules to increase. Facility expansions for bomb fabricating plants, the principal bottleneck in increasing production, were authorized even in the last months of the war ($21 million between February and April 1945), and bomb production reached its wartime peak in the months from March through June 1945 with about twice the tonnage of bombs turned out in these waning months of the war as in the corresponding months a year earlier.

NAVAL GUNS AND AMMUNITION

Production, July 1, 1940—August 31, 1945

In mid-1940, the guns installed on ships of our "one-ocean Navy" could fire a total of 411 tons of projectiles in 15 seconds. Five years later, Navy fire-power had increased more than ten-fold to 4,500 tons per 15-second period. Not only was the huge program of naval ship constructions provided with modern armament without delaying new ship completions, but the armament of the naval fleet existing in 1940 was modernized and more than 6,050 merchant vessels were supplied with guns and ammunition.

Naval Guns

During the period July 1940 through August 1945, nearly 166 thousand gun assemblies were produced; 99 percent of these were produced after December 31, 1941. The distribution of assemblies by years is shown in the table below:

NAVAL GUN ASSEMBLY PRODUCTION
July 1, 1940—August 31, 1945

(Unit-Each)

Naval Gun Assembly by Type	Total	1940 Last 6 Months	1941	1942	1943	1944	1945 First 8 Months
Total naval gun assemblies	165,742	67	1,378	35,304	60,131	53,725	15,137
6-inch and over	258	3	3	57	48	110	37
5-inch	7,581	64	143	909	1,864	3,253	1,348
4-inch and 3-inch	14,290	0	317	2,505	6,593	4,652	223
1.1-inch, 40-mm, and 20-mm	143,613	0	915	31,833	51,626	45,710	13,529

It will be noted that deliveries of larger type assemblies continued to rise after smaller types had begun to decline. The basic reasons for the difference in trend are: (a) The larger guns are used chiefly on battleships, and a much longer period is needed to complete these types of assemblies; (b) the smaller guns are used to a large degree on merchant vessels and were produced during the earlier periods for arming the merchant fleet.

Only the 1.1-inch quad-mount, the 20-mm Oerlikon, the 3-inch/50 caliber dry type, the 5-inch/38 caliber antiaircraft and dual-purpose, and the 16-inch/45 caliber assemblies were in production prior to 1942. The 1.1-inch program was completed by November 1942, since the 20-mm and 40-mm guns proved more effective and were substituted for the old 1.1-inch quad-mounts. Deliveries of 20-mm single-mount assemblies increased from 2 in July 1941 (initial delivery) to 4,693 assemblies in September 1943 (peak monthly rate), and then declined gradually, as the 40-mm guns and the 20-mm twin-mounts were substituted as quickly as they became available in place of the 20-mm single-mounts. The first delivery of 40-mm quad-mounts was made in April 1942 and the first 40-mm twins were produced two months later. The 40-mm gun program was considered very urgent until the first quarter 1945, since the requirements for these assemblies exceeded production by large margins. Cumulative requirements were not satisfied until the early part of 1945.

Fire Control

The fire control program followed the pattern of naval guns. As new guns replaced older types new fire control equipment was developed for such programs. Only one of the two antiaircraft gun directors in production prior to 1942 continued to be produced after 1942. The Mark 37 antiaircraft director for 3-inch and 5-inch guns was continued through August 1945, whereas the Mark 44 director for 1.1-inch battery was completed in May 1942. The Mark 51 gun director for 1.1-inch and 40-mm guns was one of the larger fire control programs; these directors were produced in large quantities during the three-year period from June 1942 until the first half of 1945, when the new blind fire control systems were gradually introduced, shifting production emphasis from the older type Mark 51.

Naval Ammunition

Gun ammunition and naval rockets amounting to 1,356,496 tons were produced since June 30, 1940. This production is broken down by types in the table on the following page:

NAVAL GUN AMMUNITION AND ROCKET PRODUCTION
July 1, 1940—August 31, 1945

(Unit-Short Ton)

TYPE OF AMMUNITION	Total	July 1940 through Dec. 1941	1942	1943	1944	1945 First 8 Months
Total naval gun ammunition and rockets	1,356,496	35,192	100,589	276,895	517,906	425,914
Surface fire	424,260	15,659	38,082	65,724	168,056	136,739
High capacity	251,395	0	2,286	32,897	105,421	110,791
Armor piercing	111,540	15,049	23,185	21,055	39,229	13,022
Illuminating	29,922	365	2,689	5,644	10,660	10,564
Common and special common	31,403	245	9,922	6,128	12,746	2,362
Antiaircraft	738,366	19,533	62,090	202,951	292,213	161,579
Rockets	193,870	0	417	8,220	57,637	127,596

The shift in trends of ammunition production among types indicates the changes in methods of warfare and the introduction of new weapons. Antiaircraft and armor piercing ammunition represented 83 percent of total produced through December 1943. Subsequently, as the United States Navy took the offensive in 1944 and 1945, procurement of rockets and high capacity bombardment ammunition increased much more rapidly than other segments of the Navy ammunition program. Rockets and high capacity ammunition accounted for only 11 percent of total naval gun ammunition and rockets produced prior to 1944, but represented 43 percent of the total produced in 1944 and 1945. The effectiveness of both high capacity ammunition and rockets for softening up beach heads prior to invasion created very heavy demands for these types. The requirements for high capacity ammunition were not satisfied until mid-1945, and the rocket program continued to expand until the end of the war. Both high capacity ammunition and rockets were considered critical programs during 1944 and 1945 and were given top priorities over other naval ordnance.

Bottlenecks

Many problems were encountered in the producing of vast amounts of naval ordnance. Shortages of materials, inadequate plants and plant equipment, manpower, and design changes were the principal production problems. In the earlier portion of the period, shortages of raw materials, especially steel, copper, and aluminum, and the low quality of some materials caused many delays in naval ordnance programs. Changes in design, necessitating changes in machine tools, were the chief reasons for some programs getting under way slowly. Lack of plants and plant equipment caused delays in the expansion of programs or the beginning of new programs. Bearings, cables, electric motors, conveyors, and perishable tools were very tight during most of the war program.

Facility Expansion

Production of the vast quantities of naval ordnance was made possible only by rapid and constant expansion of facilities. Prior to 1940, all naval guns and most fire control equipment were produced at the Naval Gun Factory, Washington, D.C., and all ammunition was assembled at various naval ammunition depots. Expansion of the ordnance programs required new naval ordnance plants, depots, and other facilities, the estimated cost of which totaled more than $850 million. In addition, the Bureau of Ordnance depended upon approximately 1,400 prime contractors and 20,000 subcontractors. Expansion of commercial production facilities involved technical and financial assistance for many private plants; during the war period the value of government-financed facilities and equipment added to these plants totaled about $390 million.

COMBAT VEHICLES AND MOTOR CARRIAGES FOR SELF-PROPELLED GUNS

It was estimated in May 1940 that the German Army had 8,000 tanks in service—16 times the number available to the United States Army at that time. Productions for our Army at the beginning of the war program (the second half of 1940) was proceeding at a rate of about 50 per month, and acceptances were confined entirely to light tanks armed with 37-mm guns. No medium tanks were accepted by the War Department until July 1941.

The remarkable production record of this industry, developing as it did from these almost negligible levels, is borne out by the data in the table on the following page:

COMBAT AND MOTOR VEHICLE PRODUCTION
Selected Groups, July 1, 1940—August 31, 1945

(Unit-Each)

GROUP	Total	1940 Last 6 Months	1941	1942	1943	1944	1945 First 8 Months
Total new tanks (excl.Special Purpose)	86,732	280	3,923	23,884	29,497	17,565	11,583
Heavy	2,079	0	0	1	35	54	1,989
Medium	55,779	0	1,332	12,936	21,250	13,468	6,793
Light	28,874	280	2,591	10,947	8,212	4,048	2,801
Remanufactured and modernized tanks	4,730	0	0	0	0	2,079	2,651
Tank conversions	5,506	0	0	10	682	2,946	1,868
Armored cars	16,438	0	0	191	9,067	5,509	1,671
Scout cars and carriers	89,072	551	7,332	16,892	37,977	18,874	7,446
Tank chassis for self-propelled guns	16,133	0	0	3,100	9,035	2,934	1,064

Early Expansion

In August 1941, the War Department let a $100 million order for tanks, and from that time on, developments came quickly. The immediate goal of the Army at this time was to produce 880 medium tanks, 2,300 light tanks, and 1,096 scout cars for eight armored divisions, with equipment for 15 separate tank battalions.

The automotive industry was already producing military vehicles and was slated to become the main source for tank production. In November 1941, plans were announced for expanding the Chrysler tank arsenal, which by that time had a $127,000,000 order for the production of medium (28-ton) tanks, and development of a $25,782,000 General Motors tank arsenal at Flint, and a $39,000,000 Ford tank project.

Production goals were then set for 2,000 medium tanks a month, with facilities for materials such as armor plate set up on a basis of 3,000 medium tanks a month. Detroit was depended on to account for at least two-thirds of medium tank production, tonnage-wise, and in number to account for the greater part of the entire tank program.

The prospects at that time were that the General Motor-Ford-Chrysler expansion program could not be expected to reach the initial production stage before the summer of 1942, and that production of 2,000 tanks a month could not be attained before the end of 1942. It is interesting to note that it was planned to use stock passenger car motors instead of airplane-type motors in these tanks.

The 1941 production goal was more than met. Approximately 2,600 light tanks were produced, along with 1,332 medium (28-ton) tanks, and 1,908 scout cars. Also produced were 6,000 tank engines (of which 5,450 were of the aircraft-type) and 5,424 half-tracks. At this time the 60-ton heavy tank was a highly secret Army project.

Tank Engines

During 1942, an attempt was made to standardize on a single tank engine. This was not accomplished, however, in view of the heavy requirements for engines and the lack of facilities for the many units of a single type of engine. Instead, production was distributed among the four following types:

1. Wright Whirlwind—Continental motors
2. General Motors—twin diesel
3. Chrysler—multi-bank
4. Ford V-8—liquid-cooled

Nevertheless, plans for a standard tank engine went ahead and were given additional impetus by the battle experience gained in the Libyan campaign. Tank battle performance led the Development Section of the Tank Automotive Center to favor an air-cooled gas engine. It was found that this type of engine operated best in temperature extremes and required a minimum of maintenance and repair.

Tank Production: 1942—1945

The 1942 program was a success. The planned shift from production of light tanks to medium tanks was effected, and by the end of the year the prospect of a production rate of 2,000 medium tanks a month became an accomplished fact. Altogether a total of 23,884 tanks were produced, including 12,936 medium tanks, 10,497 light tanks, and one pilot model of the M6 (60-ton) heavy tank. December 1942 marked the peak month during the war for tank production, with 4,772 produced.

Tank output in 1943 hit a new yearly high of 29,497 tanks—24 percent greater than production in 1942. While light tank output declined from 10,947 in 1942 to 8,212 in 1943, acceptances of medium tanks jumped from 12,936 to 21,250 during the same period. No standard tank engine had yet been put out, but Continental Motors (aircraft-type) had the largest single order in 1943.

Tank production leveled off in 1943 on the basis of December 1942 schedules. Earlier schedules were dictated by the African campaign, which called for tanks in very large numbers, and production was keyed to requirements by having 11 of the country's largest manufacturers making M4 mediums at steadily increasing rates. At the conclusion of this campaign prime emphasis was put on other programs also depending heavily on alloy steel, namely aircraft, naval escort vessels, and merchant vessels. Consequently, builders of the M4 tank were reduced from 11 to 3.

The 1944 schedules for tanks and other armored vehicles were reduced in October 1943, and some experts went so far as to suggest that tanks may have "had their day." The October schedule was reduced again on January 1, 1944, and monthly production after the first quarter was close to the rate set down for the January 1 schedule. However, invasion losses of materiel on the Normandy beachhead were heavier than anticipated. Because of enemy shore defenses and poor weather much materiel was lost in the sea, and at the same time, greater than previously anticipated losses were being experienced on the Italian Front.

On July 1, 1944, following D-day, tank requirements were increased slightly. Greater increases were scheduled for 1945. Current production rates had been set so far in advance, however, that greater increases for 1944 were not feasible. Total output in 1944 amounted to 17,565 tanks, and for 1945, requirements were raised to 21,227 tanks. These increased requirements were expected to put locomotive manufacturers, who had finished tank contracts some months earlier, back on tank production.

The major development in new models during 1944 was the step-up in fire-power and speed. The M4 medium tanks were given hitting power once thought adapted only to heavies. The new light tank, the M24, was equipped with a 75-mm gun formerly used as standard armament for the M4 medium. The "Sherman" medium appeared with a 105-mm howitzer, and another model was mounted with the long-barreled, high-velocity 76-mm gun. A self-propelled motor carriage for the 76-mm gun (tank destroyer) with a road speed of 50 miles per hour was also developed.

The December 1, 1944, tank schedule projected the medium 76-mm gun tank as the single type to be most heavily procured in 1945—displacing the 105-mm howitzer tank from top procurement in 1945. Furthermore, the fact that 55 percent of the schedule for 1945 tank procurement at that time was concentrated in the 90-mm and 76-mm gun types, as compared with 44 percent so recently as November 1, 1944, indicated increased procurement of selected strategically important tanks dictated by battle experience on the Western Front.

The increase in scheduled procurement for the light tank M24 mounting a 75-mm gun and the concurrent decline in 1945 schedules for the medium M4 tank with the 75-mm gun, suggested that the light tank with 75-mm gun would supersede the medium 75-mm gun tank. This was made possible by development of the 75-mm gun, T13E1, the first 75-mm gun successfully mounted in the turret of a light tank. This gun was adaptable to a light tank because it was lighter than other guns of similar fire-power and because its concentric recoil mechanism took up less space in the tank turret. The M24 light tank itself incorporated improved torsion bar suspension for greater flotation and flexibility, together with greater accessibility of all components.

Tank production in 1945 reached its peak in March, when 2,268 units were turned out--the highest rate since mid-1943. Output fell off in April and May and dropped sharply thereafter according to plan. The most noteworthy development of the period was the steady increase in output of the heavy Pershing tank M26 mounting a 90-mm gun. In May 1944, when this tank was still in the experimental stage, 145 units had been scheduled for the year 1945; total 1945 production through August actually amounted to 1,952 units.

Other Armored Vehicles

In addition to the tank production, the combat vehicle program expanded in the production of other armored vehicles. The first deliveries of armored cars were made in 1942, and a new large program of motor carriages for self-propelled guns was initiated. The 16,892 scout cars and carriers produced that year were 130 percent more than the 7,332 units produced the year before. In 1943, record production was achieved for armored cars as well as for scout cars and carriers. Motor carriages for self-propelled guns also attained their highest level in 1943, with 9,035 of the tank chassis type produced and 11,524 of other chassis types.

Remanufacturing and Reconditioning

Another significant development in the combat vehicle program was the substantial increase in remanufacturing and reconditioning. In October 1944, the Chrysler Corporation began work on its $77 million contract for overhauling and modernizing M3's and M4's in its Evansville, Indiana plant, where formerly cartridges were made, and the American Car and Foundry Company began work on modification of 1,200 M5 light tanks. The work consisted mainly of installing heavier armor and greater fire-power.

Development and Research

On the experimental list for development and research at the end of the war were the following combat vehicles and motor carriages for self-propelled guns:

1. Heavy tank T29 with 105-mm gun
2. Heavy tank T26E2 with 105-mm howitzer
3. Heavy tank T30 with 155-mm gun
4. Motor carriage T93 for 8-inch gun
5. Motor carriage T89 for 8-inch howitzer
6. Motor carriage T92 for 240-mm howitzer

TRUCKS

The automotive industry had little difficulty in shifting over from the high prewar level of civilian-type passenger car and light truck production to the light and medium types of military vehicles (under 2½-ton rated capacity), which comprised the major part of the Army truck program in terms of numbers of units. The ever increasing requirements for the heavy types (2½-ton or over rated capacity) during the war period, however, raised some difficult production problems. The following table gives production figures on Army trucks.

ARMY TRUCK PRODUCTION
July 1, 1940—August 31, 1945

(Unit-Each)

GROUP	Total	1940, Last 6 Months	1941	1942	1943	1944	1945 First 8 Months
Total Army-procured trucks	2,357,684	20,299	176,884	618,423	618,728	596,374	326,976
Heavy-heavy (Over 2½-ton)[a]	151,449	500	8,363	23,347	37,271	51,127	30,791
Light-heavy (2½-ton)	800,507	6,460	57,010	180,809	192,377	219,529	144,322
Medium (1½- and under 2½-ton)	418,982	6,605	37,008	140,296	132,602	80,517	21,954
Light (Under 1½-ton)	986,746	6,684	74,503	273,971	256,478	245,201	129,909

[a] Excluding Engineer Corps types prior to 1944 except the 7½-ton 4x4, "Snow-go," in 1943; data are not available on any other types.

It will be noted that the peak year for both light and medium types was reached in 1942, and the peak year for the two heavy types was not reached until 1944. The peak month for heavy-heavy trucks was actually December 1944 when 6,246 units were accepted; light-heavy trucks hit their peak in March 1945 with an output of 22,620 vehicles.

Difficulties with Heavy Trucks

Heavy trucks with four- and six-wheel drives had never been produced in substantial quantities before the war, and the industrial "know-how" and necessary facilities did not measure up to the tremendous needs. Chief bottlenecks were in heavy truck components, such as rear axles, engines, and transmission, which traced back primarily to shortages of manpower and materials in the foundry and forge shops. On the whole, assembly plant facilities were adequate to meet all anticipated truck requirements.

Production in 1944

The most critical year for heavy truck production was 1944. Heavy truck requirements had been rising steadily, and deliveries in 1943, although well over the 1942 record, had not yet met the demand. Because of shortages in the 1943 heavy truck program and the greatly augmented demand for heavy vehicles for the year 1944 by the Army, the Office of Defense Transportation, and other claimant agencies, the Automotive Division Requirements Committee developed a new 1944 truck program on November 2, 1943. This program was based on a determination of all facilities available and a planned expansion to increase production of the critical truck components which were the controlling factors in end-item procurement. It was expected that by the latter half of 1944 a sharp rise in heavy truck production could be effected.

Under the November 2, 1943, truck program, the Army was allowed an over-all quota for 1944 of 775,653 trucks, representing 84 percent of the grand total set for all claimant agencies. Army heavy truck allotments consisted of 295,942 light-heavies (which included combat vehicles using similar truck components) and 69,575 heavy-heavies. In February 1944, the authorized programs were cut sharply by the Army Service Forces in both critical groups. The light-heavy program was reduced to 247,691, while the heavy-heavy program was cut to 65,683. These revised 1944 programs were considered more in line with the productive ability of industry.

Availability of increased facilities in 1944 only partially solved the production lag in heavy truck components. Expansions in the foundries required a greatly enlarged force of skilled and semiskilled workers at a time when general expansion of the war economy had already resulted in a tight labor market. Labor shortages in gray iron foundries were further aggravated by the competition of higher-paying war industries involving less arduous work.

Actual production of heavy trucks in 1944 proved to be considerably below authorized programs, although large gains in output over 1943 were achieved. Expanded output in the latter half of the year resulted in a 15 percent increase in the light-heavies and a 54 percent gain in the heavy-heavies above the first six months' output in these groups. The climb in the heavy-heavy truck group was consistent, rising from a January 1944 production of 2,741 up to an all-time high of 6,246 units in December. Heavy trucks, 2½-ton and up, comprised 45 percent of the total 1944 truck output of 596,374 units.

The 1945 Program

The 1945 Army Service Forces truck program, based on a program determination as of December 19, 1944, was set at 594,257 vehicles out of a total program of 869,212 for all claimant agencies. The Army program included 252,409 light-heavies (including combat vehicles) and 48,792 heavy-heavies. In the March 5, 1945 revision, the ASF heavy truck program for 1945 was stepped up to 273,293 light-heavies and 52,337 heavy-heavies. Increased needs in the heavy categories were due partially to the considerable deficits from schedule in 1944, necessitating carryovers into 1945. Furthermore, the accelerated pace of two-front war, together with the very high attrition rate in the European theatre were important factors in causing higher military truck requirements.

The supply of necessary manpower in the foundries continued to remain a limiting factor in heavy truck production until the end of war, although the situation was partially alleviated by some wage increases, the furloughing of skilled workers by the Army, and better distribution of the supply of castings. Another difficulty which had arisen at this time was the urgent priority need which had developed for military spare parts. This additional demand on production necessarily resulted in curtailment of end item output.

Army heavy truck production in the early part of 1945 was impeded by poor weather conditions in addition to production problems. In the month of March, however, output improved considerably, with all truck groups reaching their peak production for the year. Light-heavy deliveries at 22,620 hit a record high, exceeding December 1944 the previous high month with a 20,942 unit output. After this month, production in all groups fell off and huge cuts in programs were instituted after VE-Day in May. With these great reductions in the truck program, there remained no difficulties in meeting the sharply lowered goals for heavy trucks, except for a few special types.

COMMUNICATIONS AND ELECTRONIC EQUIPMENT

Production of communications and electronic equipment during the period July 1, 1940—August 31, 1945, amounted to $10.8 billion (standard munitions dollars)—about one-seventeenth of the total munitions program over the 62-month period. Even though radio and radar output represented only a small portion of the total munitions program, its real importance to the war effort cannot be measured merely in terms of dollar value because of the essential work which radio and radar contributed to make other programs successful. Without the almost unbelievable technological advances, especially in radar, England might have fallen under German aerial attack, and many of the Allied victories in the European and Pacific theatres might have turned into losses or, at least, much less decisive and spectacular victories.

The Production Record

Communications and electronic equipment got off to a late start, compared with that of other programs. Developments in radar were particularly slow since this was virtually a new industry which required a much greater degree of technical skill than had been required in the production of radio equipment. Early procurement of radar was limited, in fact, to a very few companies which had adequate research and engineering organizations as well as highly specialized personnel. More facilities ultimately were brought in, but throughout the program radar could not be subcontracted to the extent possible with radio apparatus.

Proportionate value of output increased steadily each year relative to total munitions output, from a low of 1.3 percent in the last half or 1940 to 6.7 percent in the first eight months of 1945. Radar production, especially, expanded at a rate perhaps unparalleled in any other branch of industry. The development of the various important segments of the communications and electronics program is shown in the table on the following page:

COMMUNICATIONS AND ELECTRONIC EQUIPMENT PRODUCTION

(Unit-Million Dollars)[a]

ITEM	Total	1940 Last 6 Months	1941	1942	1943	1944	1945 First 8 Months
Total communications and electronic equipment [b]	10,759	27	226	1,512	3,043	3,739	2,212
Radio equipment	4,448	13	109	823	1,471	1,393	639
Airborne	1,830	3	29	332	685	526	255
Ship (and ship-and-shore)	592	1	5	50	170	272	94
Ground	2,026	9	75	441	616	595	290
Radar equipment	3,772	3	46	365	913	1,430	1,015
Airborne	1,935	1	11	175	395	753	600
Ship (and ship-and-shore)	936	0	1	43	207	419	266
Ground	901	2	34	147	311	258	149
Other communications and electronic equipment	2,516	11	71	324	653	905	552

a Standard (1945) munitions dollars

b Including a small amount of unclassified Communications and Electronic Equipment as follows: 1943, 6 million; 1944, 11 million; and 1945, 6 million.

As may be observed from the figures in the table above, the rate of growth in the industry was phenomenal. This is particularly true for airborne radar, output of which rose from practically nothing in 1940 to more than twice the size of any other radar or radio program in 1945. The success of the communications and electronic equipment program was achieved despite many severe obstacles, the more important of which are described below.

Lack of Previous Experience in the Field

As already indicated, the industry's over-all transition to a war basis was a difficult process. Performance standards for construction of radar, and even radio items, were so much more exacting than peacetime standards that the capacity of the industry was severely limited at first. During the first year of the war program, five principal manufacturers received four-fifths of all Army Signal Corps contracts (which constituted the great bulk of expenditures in the field), and there were reported to be less than 20 companies which the Army and the Navy considered competent to meet their specifications. At the peak of the program, three years later, there were about 260 companies making radio and radar equipment, and more than 1,000 manufacturers were making essential parts. Even then, however, only about 15 percent of the radio companies were turning out radar sets, and very little subcontracting was done in this field, because of the very exacting and changing technical requirements.

Further complications resulted from the lack of sufficient engineering talent among the Services for developing numerous completed models in their own departments.

Technological Advances and Design Changes

Closely related to this problem, of course, were the extreme number of design changes and improvements which continually plagued the industry's production lines. Technological changes in radar were dictated largely by obsolescence of particular models—often before the items reached full production—and to some extent by shifts in military strategy—from the defensive items, such as warning, interception, and IFF (identification of friend or foe), to offensive items, such as navigational and bombing equipment. Numerous changes in specifications for radar equipment also occurred after testing under battle conditions.

As an illustration of the effort expended in technological development of radar, the 1944 radar research program of the Office of Scientific Research and Development was twice the size of the next largest program, and four out of every five items of radar equipment on the 1944 schedule were not produced in the previous year. All these changes naturally created tremendous difficulties for the industry and its suppliers.

Shortages in Materials and Components

In addition to the technological changes, shortages of critical raw material necessary for the completion of components created another major problem. Manufacturers of electronic tubes had difficulty in obtaining raw materials in sufficient time to produce these critical components. Coupled with the fact that the average procurement cycle of most of the critical components was from four to six months, and with the numerous changes in design, even after a contract had been accepted, manufacturers experienced considerable difficulty in meeting the requirements on time, for the large influx of military orders.

Facilities Expansion

The large end-equipment programs naturally forced a marked growth in the communications and electronic industry and its suppliers. Radio and radar facility expansions over the period January 1, 1941—June 30, 1945, amounted to $227 million, two-thirds of which had to be jammed into 1942 and 1943, to enable the industry to meet its peak load in 1944. Despite these great increases, lack of facilities was still a problem at the end of 1944, in one area at least—production of field and assault wire. At this time, fast-moving troops and destructive artillery fire in the European theatre caused such unprecedented and unforeseen destruction of this type of equipment that requirements were nowhere near being met. Lack of facilities in production of certain sizes of carbon steel wire and for stranding operations, as well as a shortage of manpower, were most critical at that time.

Manpower

Manpower for the radio and radar industry was a difficult problem all through the war period, demanding special attention and reports from the War Manpower Commission at various times. As indicated above, the shortage of skilled technicians in the industry was acute. Radar, especially, was young, and a large proportion of the workers were young men between the ages of 21 and 26. In one large vacuum tube company, for instance, 60 of the 73 engineers were under 26. Many workers in this large group were drafted into the Service (some later returned), despite continued appeals by industry and a special Selective Service urgency rating.

A contributing difficulty to the manpower problem was the historically low pay of the wage workers in the industry—probably because of the predominance of women in the field. Most of the plants were in tight labor areas and competed with many higher-paying war plants. For example, in Newark, New Jersey, an area accounting for about 50 percent of all tube output, starting wages in the tube factories ranged from 50 cents to 54 cents per hour. In the same area, however, starting wages for women in the machine tool industry, steel, shipbuilding, or chemical industries ranged from 70 cents to 94 cents per hour. A direct attack on this problem—of keeping up employment in an historically low-paid industry which suddenly became very essential in wartime—was never really made during World War II, and the communications and electronic equipment industry was one of the greatest sufferers as a result.

AVIATION GASOLINE

When the complete history of World War II production is written it will be recorded that petroleum was one of the indispensable requirements of the United Nations for the conduct of this war. The rapidity with which the Axis Powers engulfed the world left America as the one source from which the enormous quantities of petroleum products needed to fuel the Allied war machine could be obtained. How American ingenuity and resourcefulness, with the cooperation of government and industry, met this challenge is one of the truly amazing stories of wartime production.

High-octane Gasoline Production

In 1941, when war came to the United States, production of high-octane gasoline averaged about 37 thousand barrels per day. By the end of 1942, after one year of war, the average daily production of high-octane fuel had more than doubled from that of the previous year, reaching 79 thousand barrels daily. This was only the beginning. During the period 1941-1944, United States production of high-octane gasoline doubled each year, and in the year 1944 alone more 100-octane gasoline was blended than in all the preceding years 1935-1943 combined. Average daily production for 1944 reached 376 thousand barrels, and in May 1945, a peak production rate of 514 thousand barrels daily of high-octane gasoline was achieved.

For the period January 1, 1942, through August 31, 1945, the United States blended approximately 344.7 million barrels of combat grade gasoline, most of which was 100-octane (Grade 130). During this same period, foreign blending of aviation gasoline accounted for 56.6 million barrels. In addition to these blended grades, approximately 14 million barrels of other high quality aviation fuels were made available, bringing the total of high quality aviation gasoline made available during this period to 415.3 million barrels.

Approximately 75.7 million barrels of Grade 91/96, primarily utilized in this country for training, were produced from January 1942 through July 1945.

New Plant Construction

The increases in United States production were obtained, to a great extent, by conversion of existing refinery equipment. The limit of this source of additional production was reached, however, in the early months of 1943, and further increases depended upon the completion of new plants. A scheduling procedure for the erection of 100-octane gasoline plants was begun in April 1943, and by the end of 1944 production capacity (but not actual production) was in excess of the ultimate requirements for consumption.

Deliveries of Critical Equipment

Difficulties in obtaining delivery of critical types of refinery equipment held up the earlier expansion programs to a great extent, but with priority ratings and special directives freezing the delivery dates of critical items, this problem gradually decreased and other problems such as manpower shortages and labor troubles held up capacity production.

Despite the rapid rate at which production expanded from 1942 to 1945, it was not until after VE-Day that production caught up with the increasing requirements for high quality aviation gasoline. In 1942, ultimate requirements for aviation gasoline were 150 thousand barrels per day; a few months later they were up to 400 thousand barrels, and by November 1944 the target was set at 612 thousand barrels daily.

Higher Specifications for Gasoline

Not only were production sights boosted consistently throughout the war period, but at the same time the petroleum industry was faced with the problem of boosting quality. Throughout the war, planes were constantly being built to fly higher, farther, and faster, and to carry heavier and heavier bomb loads, and more and more planes were coming off the assembly lines with an increasing number of missions per plane. Consequently the petroleum industry was constantly faced with the dual problem of increasing production and at the same time boosting quality. Yet, despite this pressure on the industry, planes were not grounded for lack of fuel—the gap was always filled by lower grade fuels.

Production Factors

Estimates of foreign production show that, excluding U.S.S.R., United States production of aviation gasoline during the war was approximately six times that of all Allied Nations' foreign production. A breakdown of factors contributing to our enormous production of aviation gasoline shows that 47 percent of the 800 percent increase from 1942 through 1944 was a direct result of "refinery ingenuity," while the remaining 53 percent came from new construction and equipment amounting to approximately $700,000,000.

The following table shows the factors contributing to total 100-octane (Grade 130) gasoline production:

FACTORS INVOLVED IN PRODUCTION OF 100-OCTANE (GRADE 130) GASOLINE
January 1942—August 1945

FACTORS	Percent of Total
Total	100.0
New facilities	41.4
Prewar facilities	18.3
Foreign facilities	13.7
Cumene	6.1
Increased TEL, 4.0-4.6 cc.	4.2
Converted catalytic units	4.0
Codimer	2.9
Ordnance and rubber programs	2.5
C-S	1.1
Miscellaneous	5.8

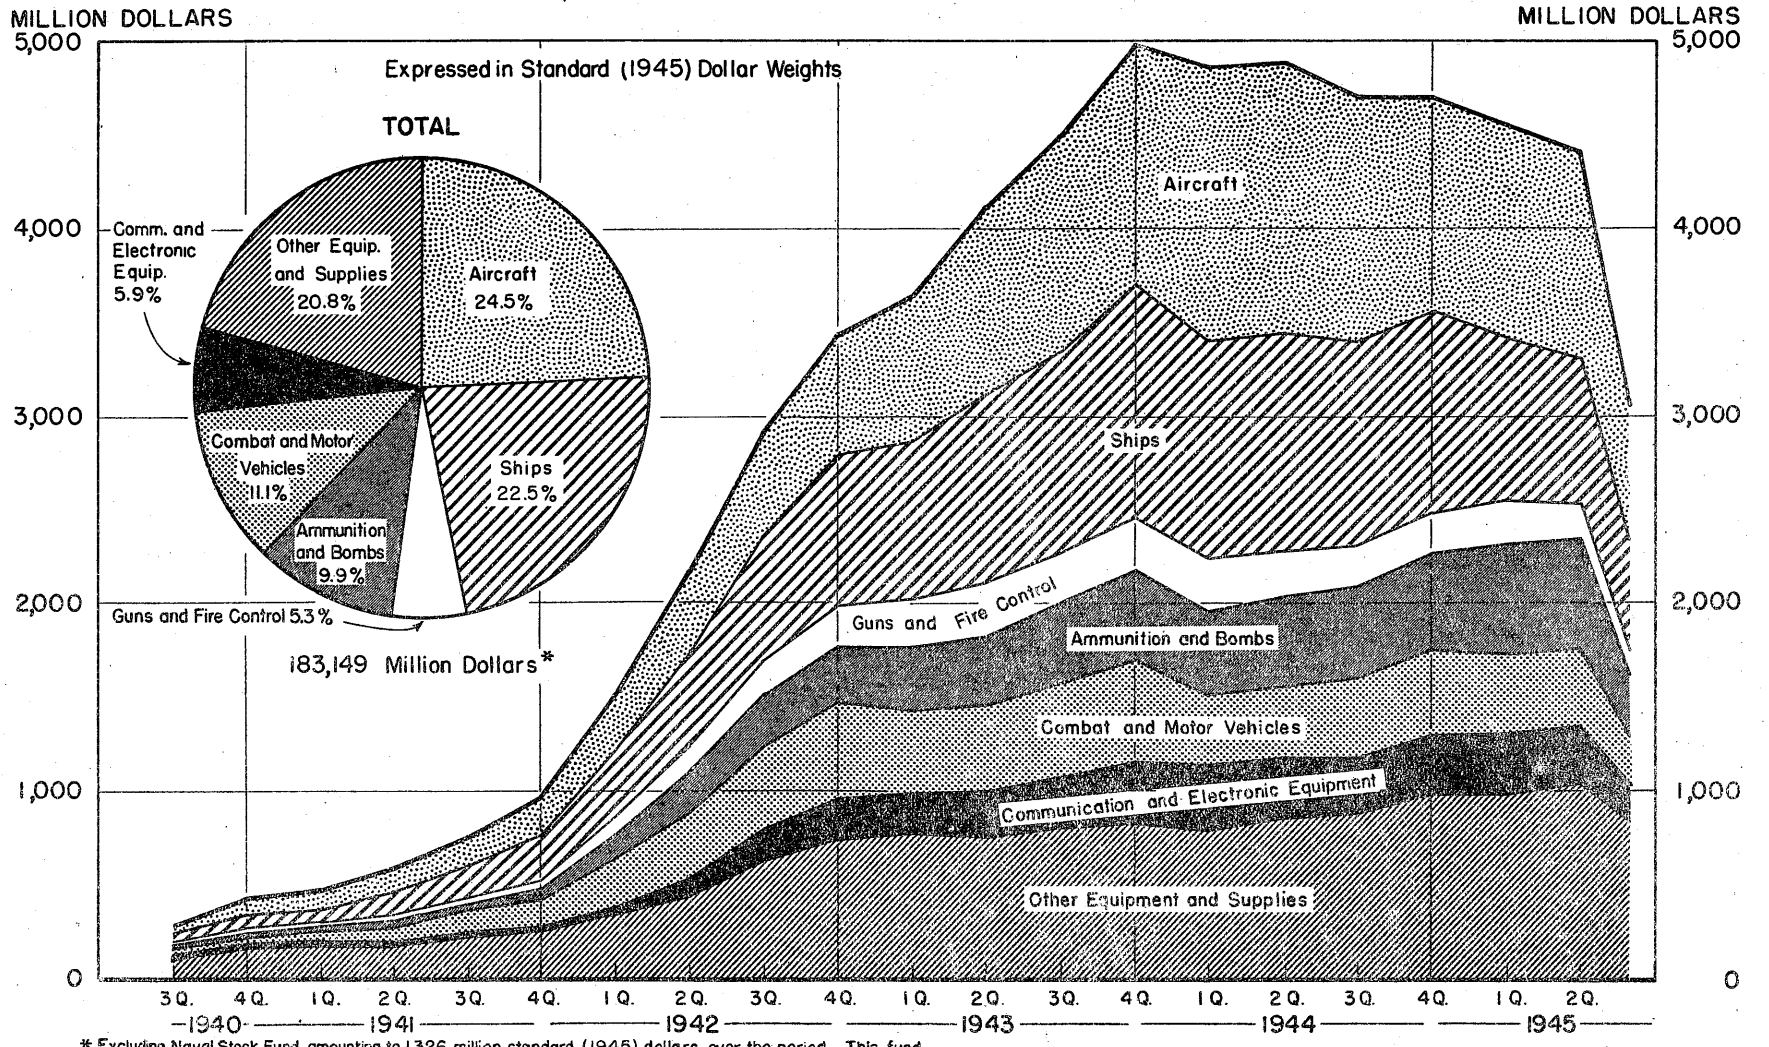
CHART SUPPLEMENT

CHART I

VALUE OF THE U.S. MUNITIONS PRODUCTION PROGRAM*

AVERAGE MONTHLY PRODUCTION, BY QUARTERS

JULY 1, 1940 - AUGUST 31, 1945



* Excluding Naval Stock Fund, amounting to 1,326 million standard (1945) dollars over the period. This fund representing the increases in goods in storage and stocks in transit between supply offices, was handled by the Navy Department Bureau of Supplies and Accounts for all bureaus, and was not assignable among specific munitions categories. Yearly increases in the Naval Stock Fund were as follows: 1940 (last half) 28, 1941-149, 1942-320, 1943-613, 1944-148, and 1945 (first eight months) 68 million standard (1945) dollars.

SOURCE

Unpublished data from the Production Statement Special Release, July 1, 1940-August 31, 1945, prepared by the Military Division, Program and Statistics Bureau, War Production Board.

CHART II

NUMBER OF U. S. MILITARY AIRPLANES PRODUCED

AVERAGE MONTHLY PRODUCTION, BY QUARTERS

JULY 1, 1940 - AUGUST 31, 1945

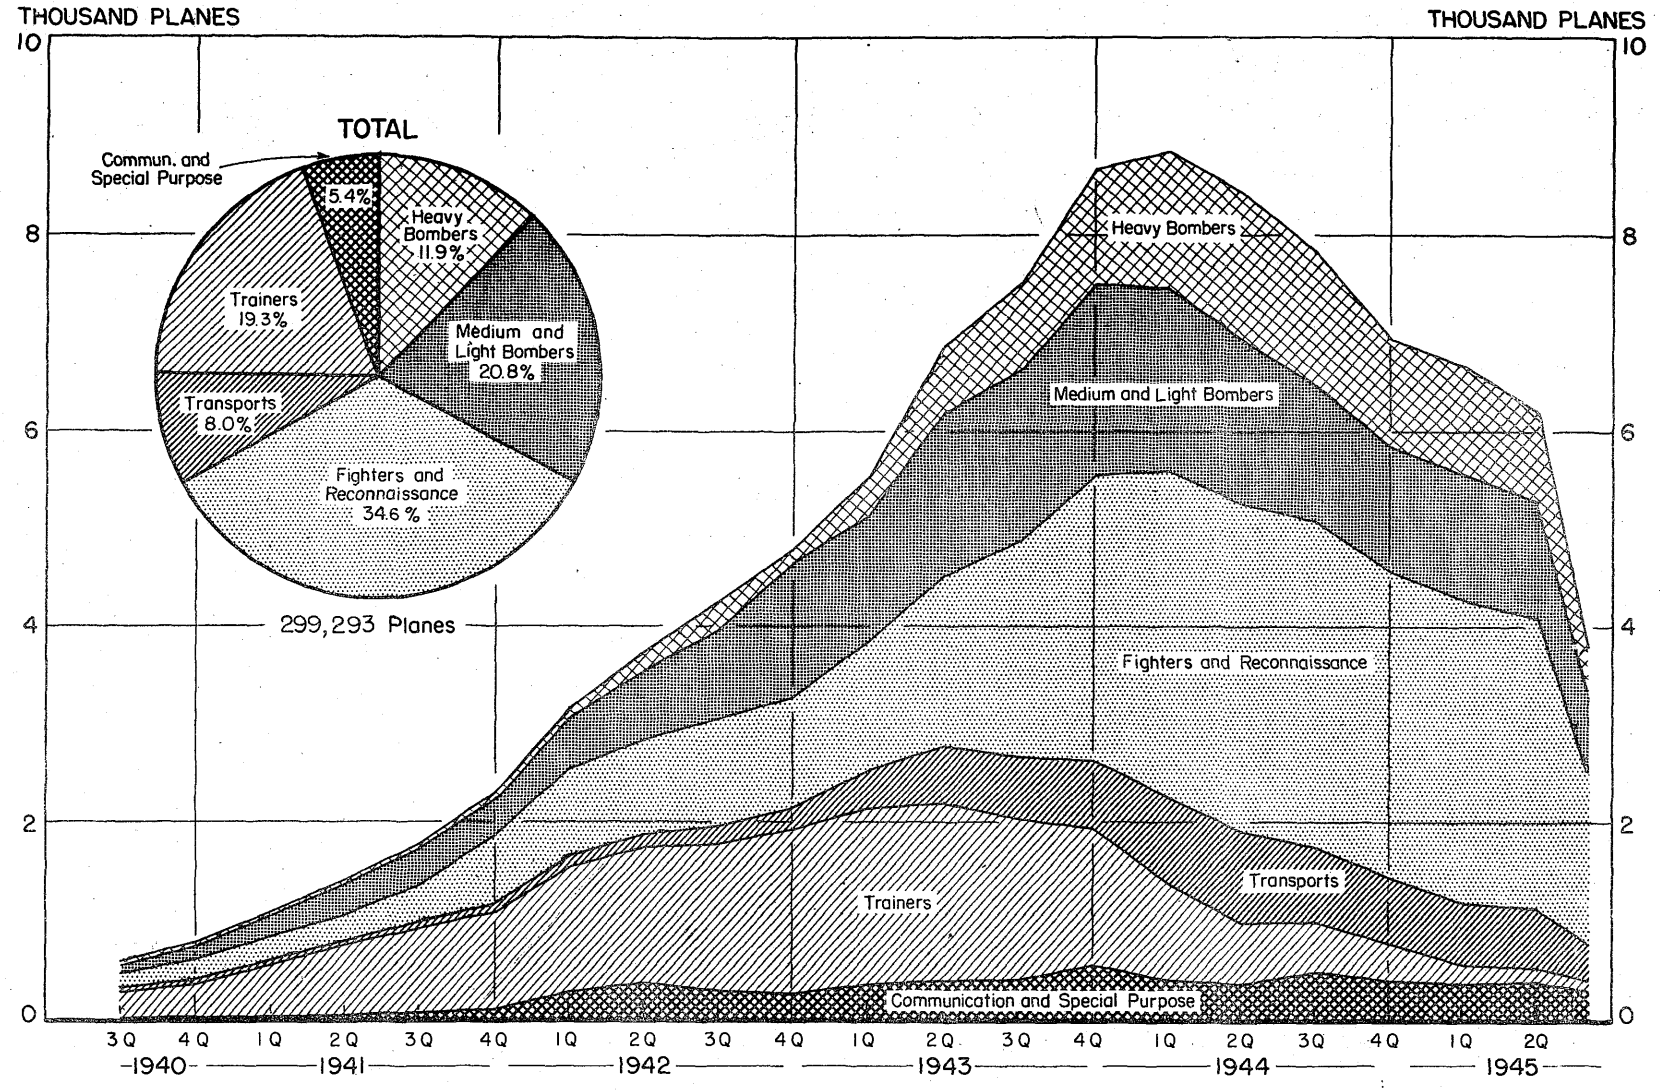


CHART III

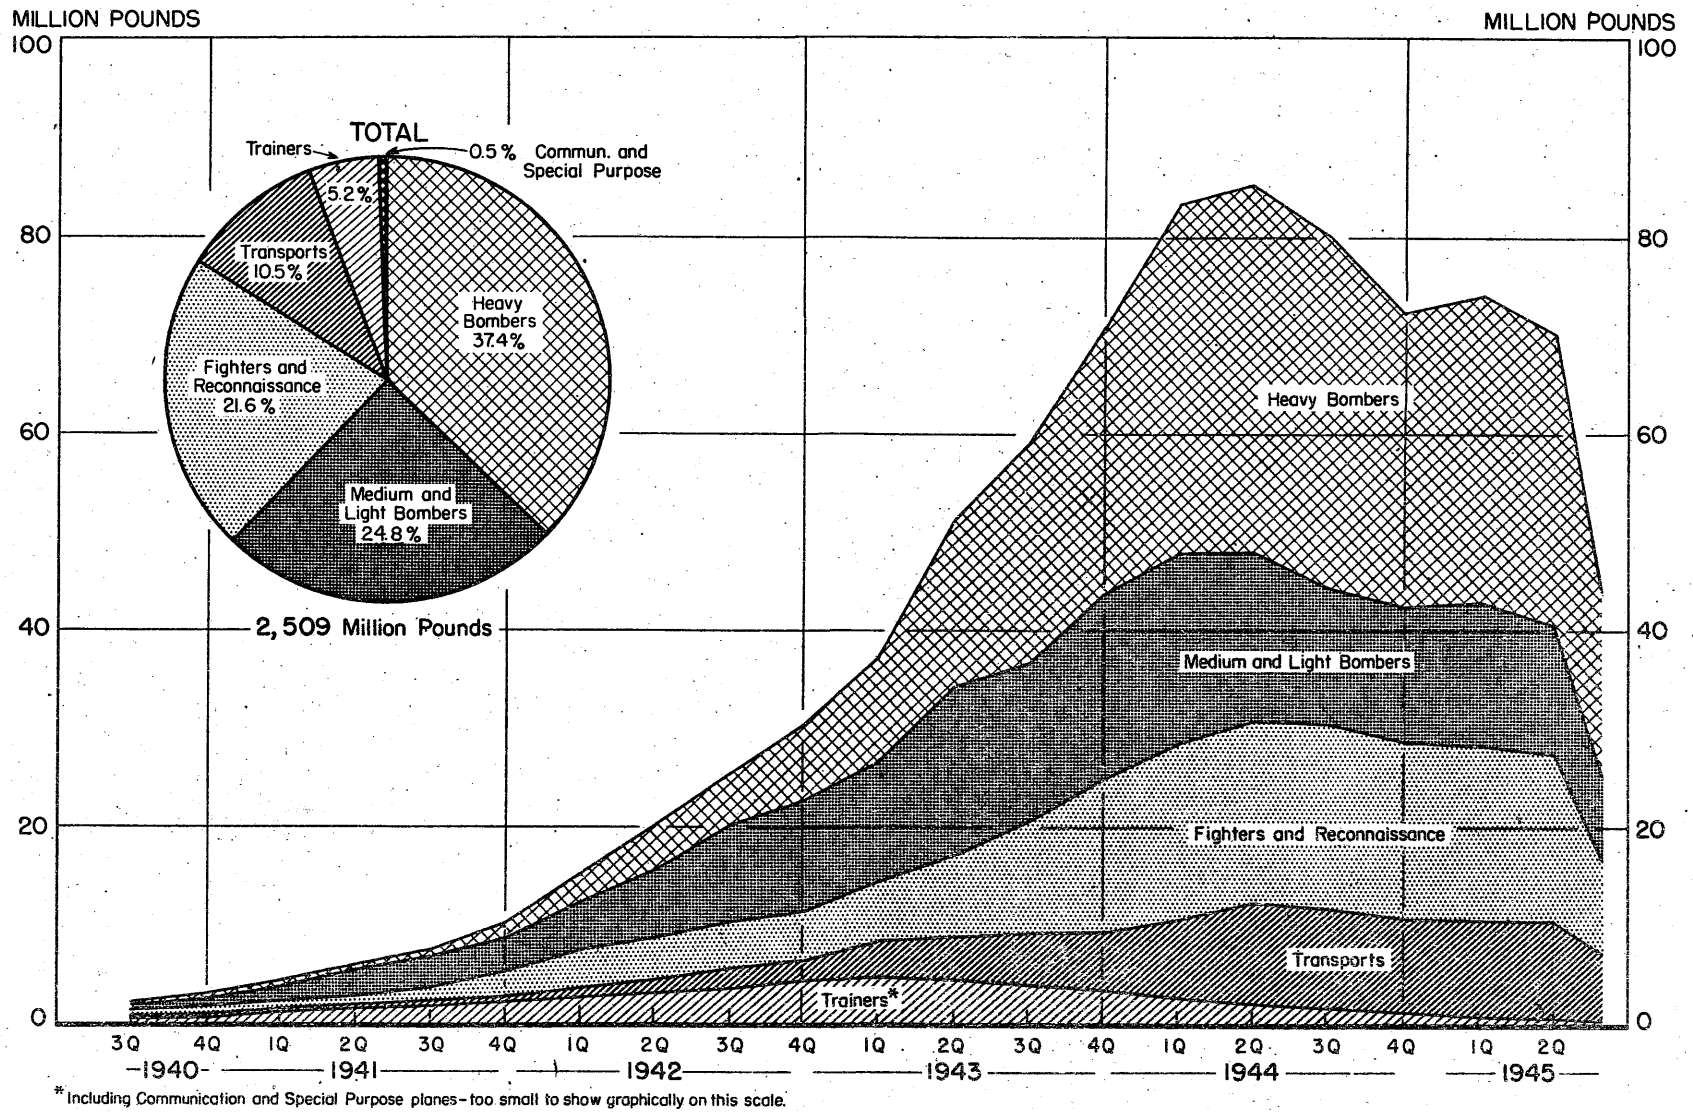
AIRFRAME WEIGHT OF U. S. MILITARY AIRPLANES PRODUCED

AVERAGE MONTHLY PRODUCTION, BY QUARTERS

JULY 1, 1940 - AUGUST 31, 1945



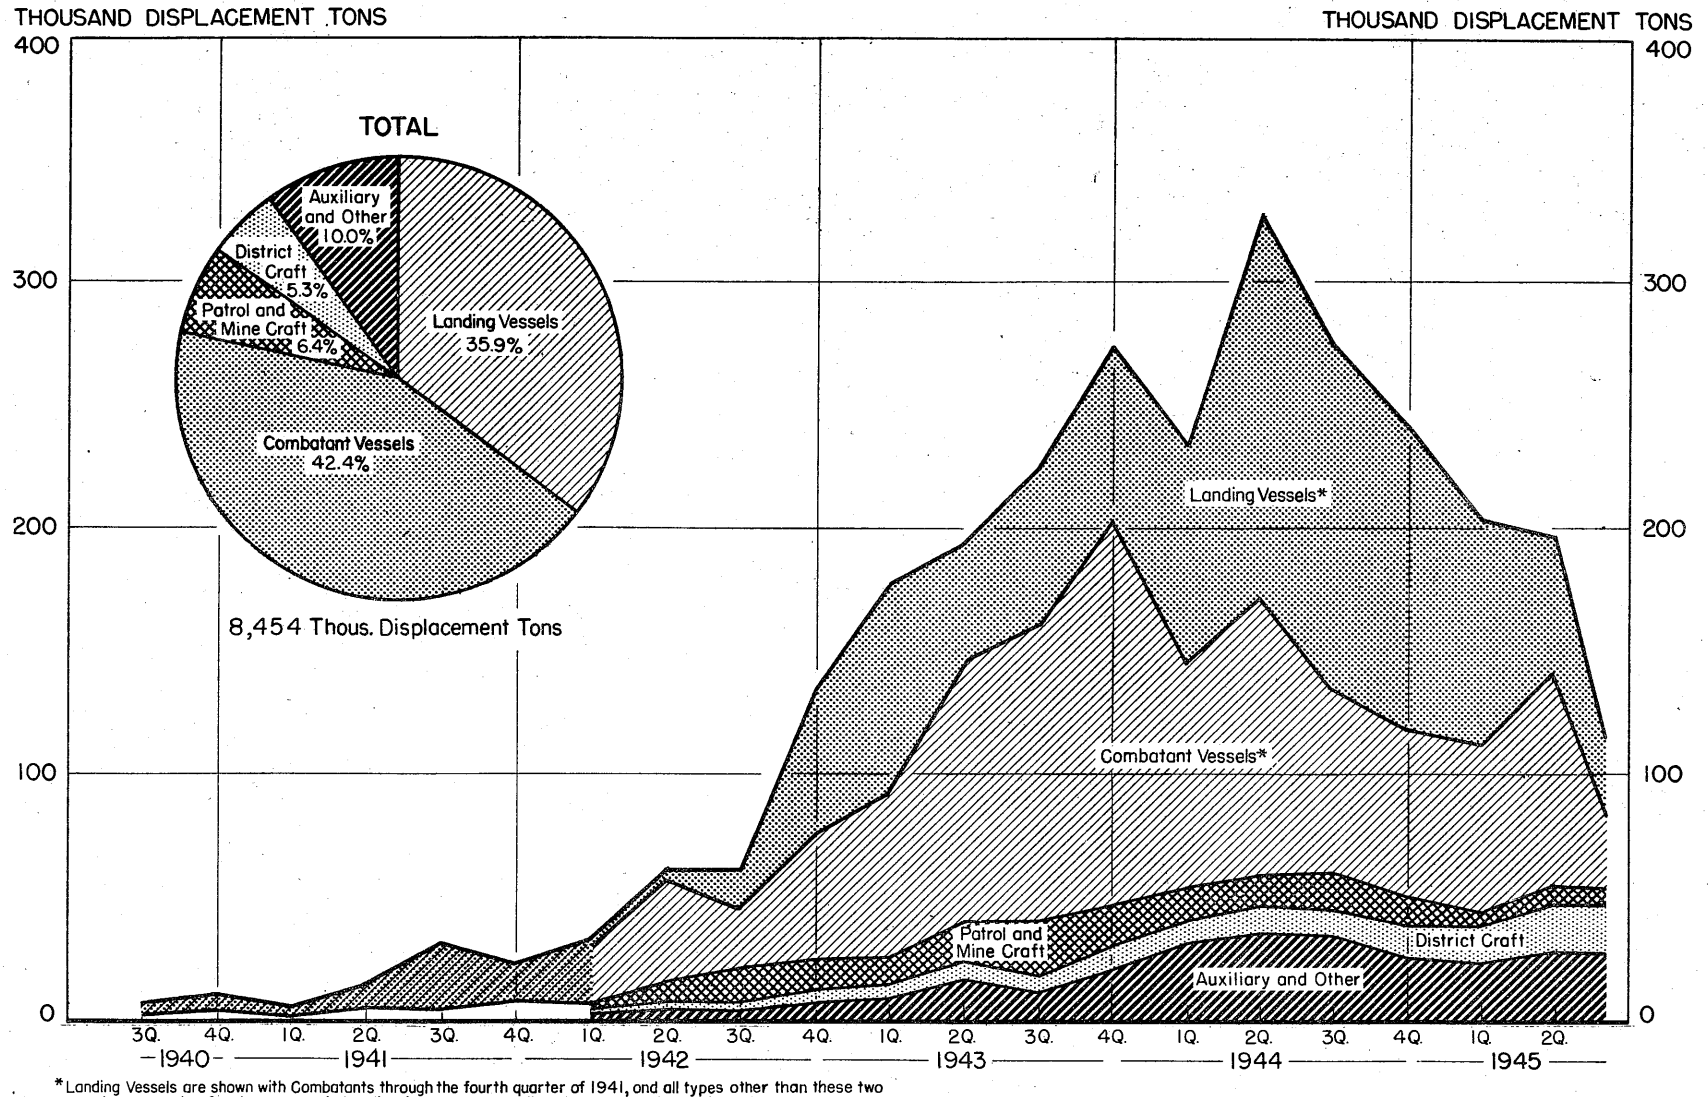
*Including Communication and Special Purpose planes - too small to show graphically on this scale.

CHART IV

TONNAGE OF U.S. NAVAL SHIPS DELIVERED

NEW CONSTRUCTION – AVERAGE MONTHLY DELIVERIES, BY QUARTERS

JULY 1, 1940 – AUGUST 31, 1945



*Landing Vessels are shown with Combatants through the fourth quarter of 1941, and all types other than these two are shown together for the same period; deliveries were too small to show separately on this scale.

CHART V

TONNAGE OF U.S. MARITIME COMMISSION SHIPS DELIVERED

AVERAGE MONTHLY DELIVERIES, BY QUARTERS

JULY 1, 1940 – AUGUST 31, 1945

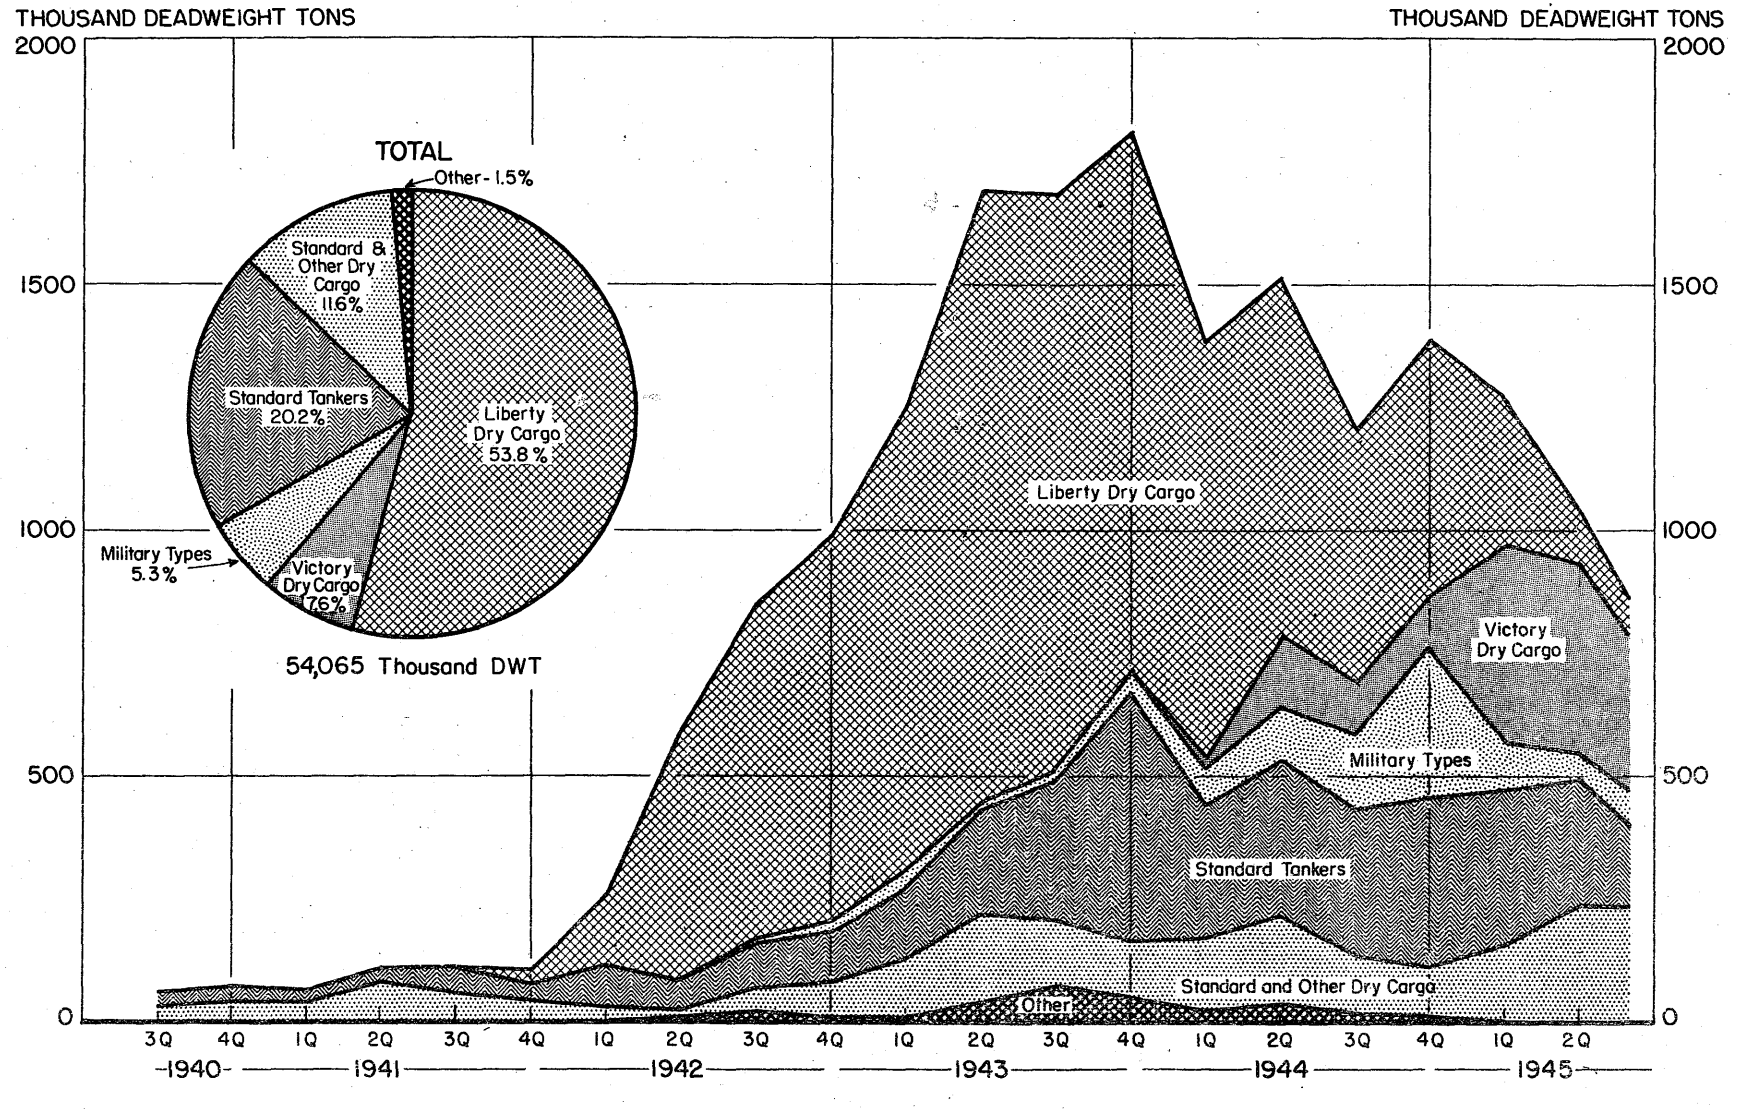


CHART VI

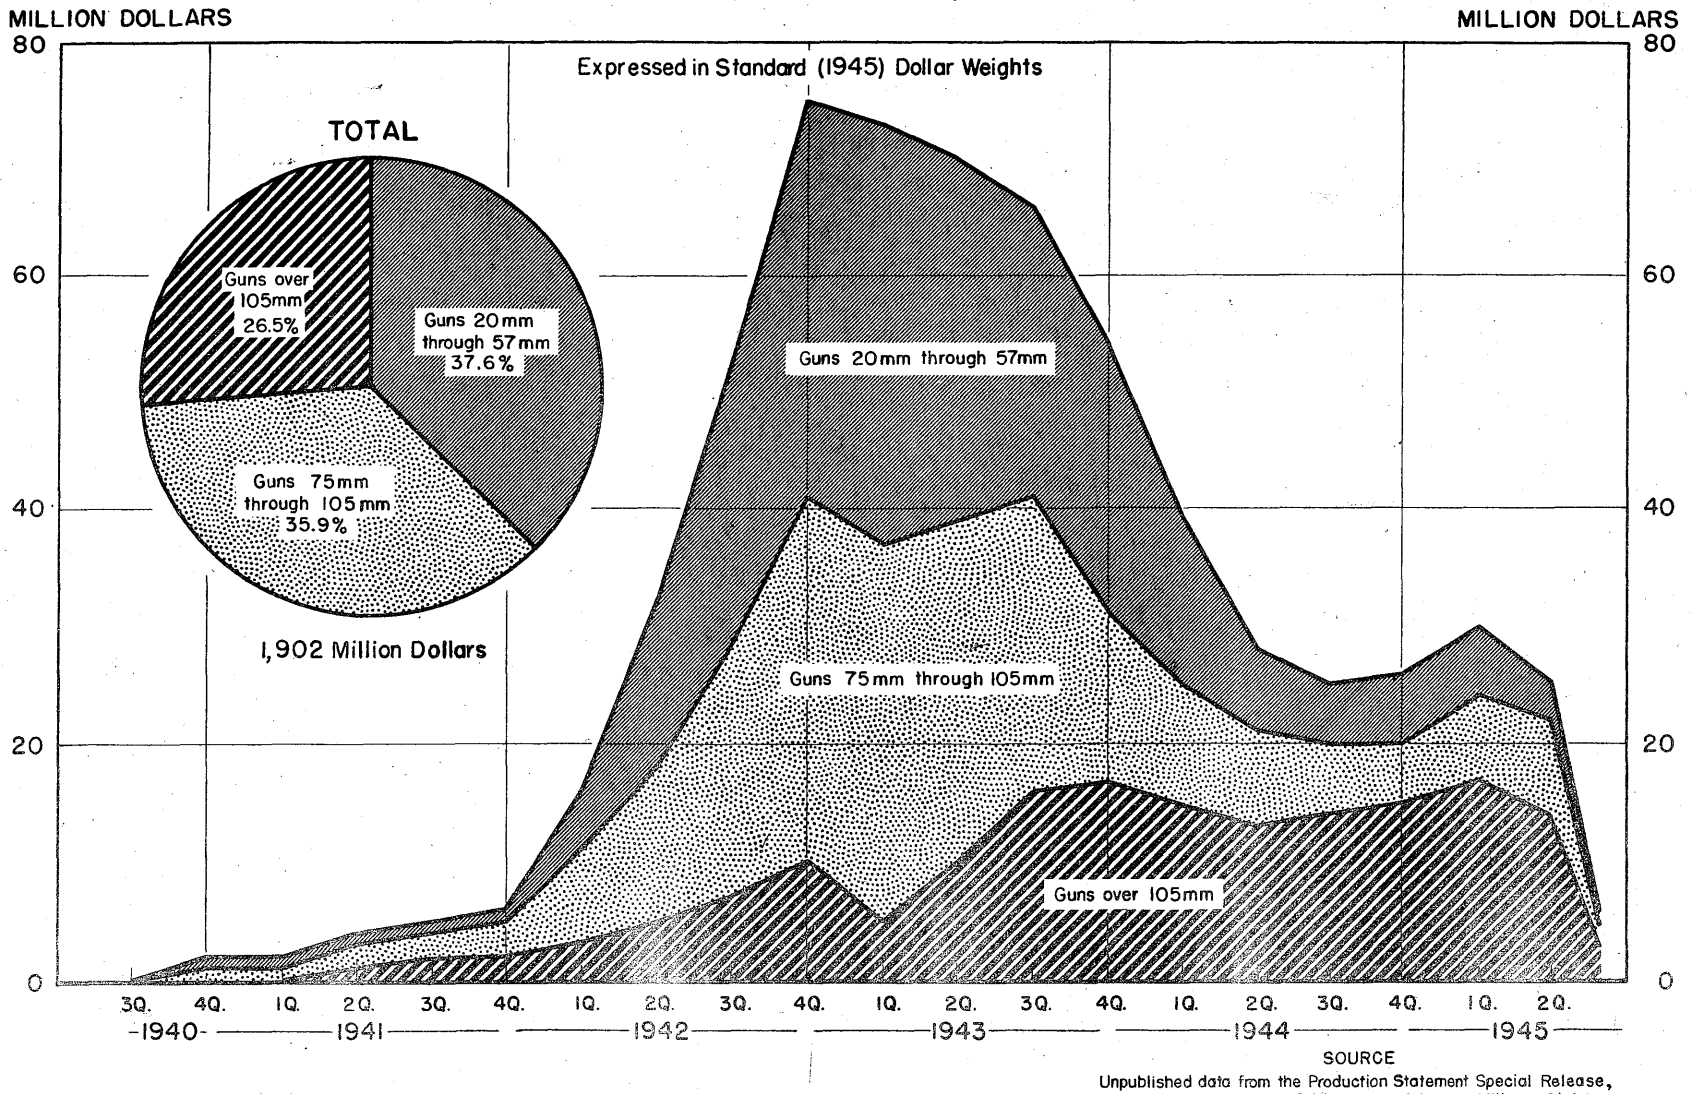
VALUE OF THE U.S. ARMY GUN PRODUCTION PROGRAM

AVERAGE MONTHLY PRODUCTION, BY QUARTERS

JULY 1, 1940 – AUGUST 31, 1945



SOURCE

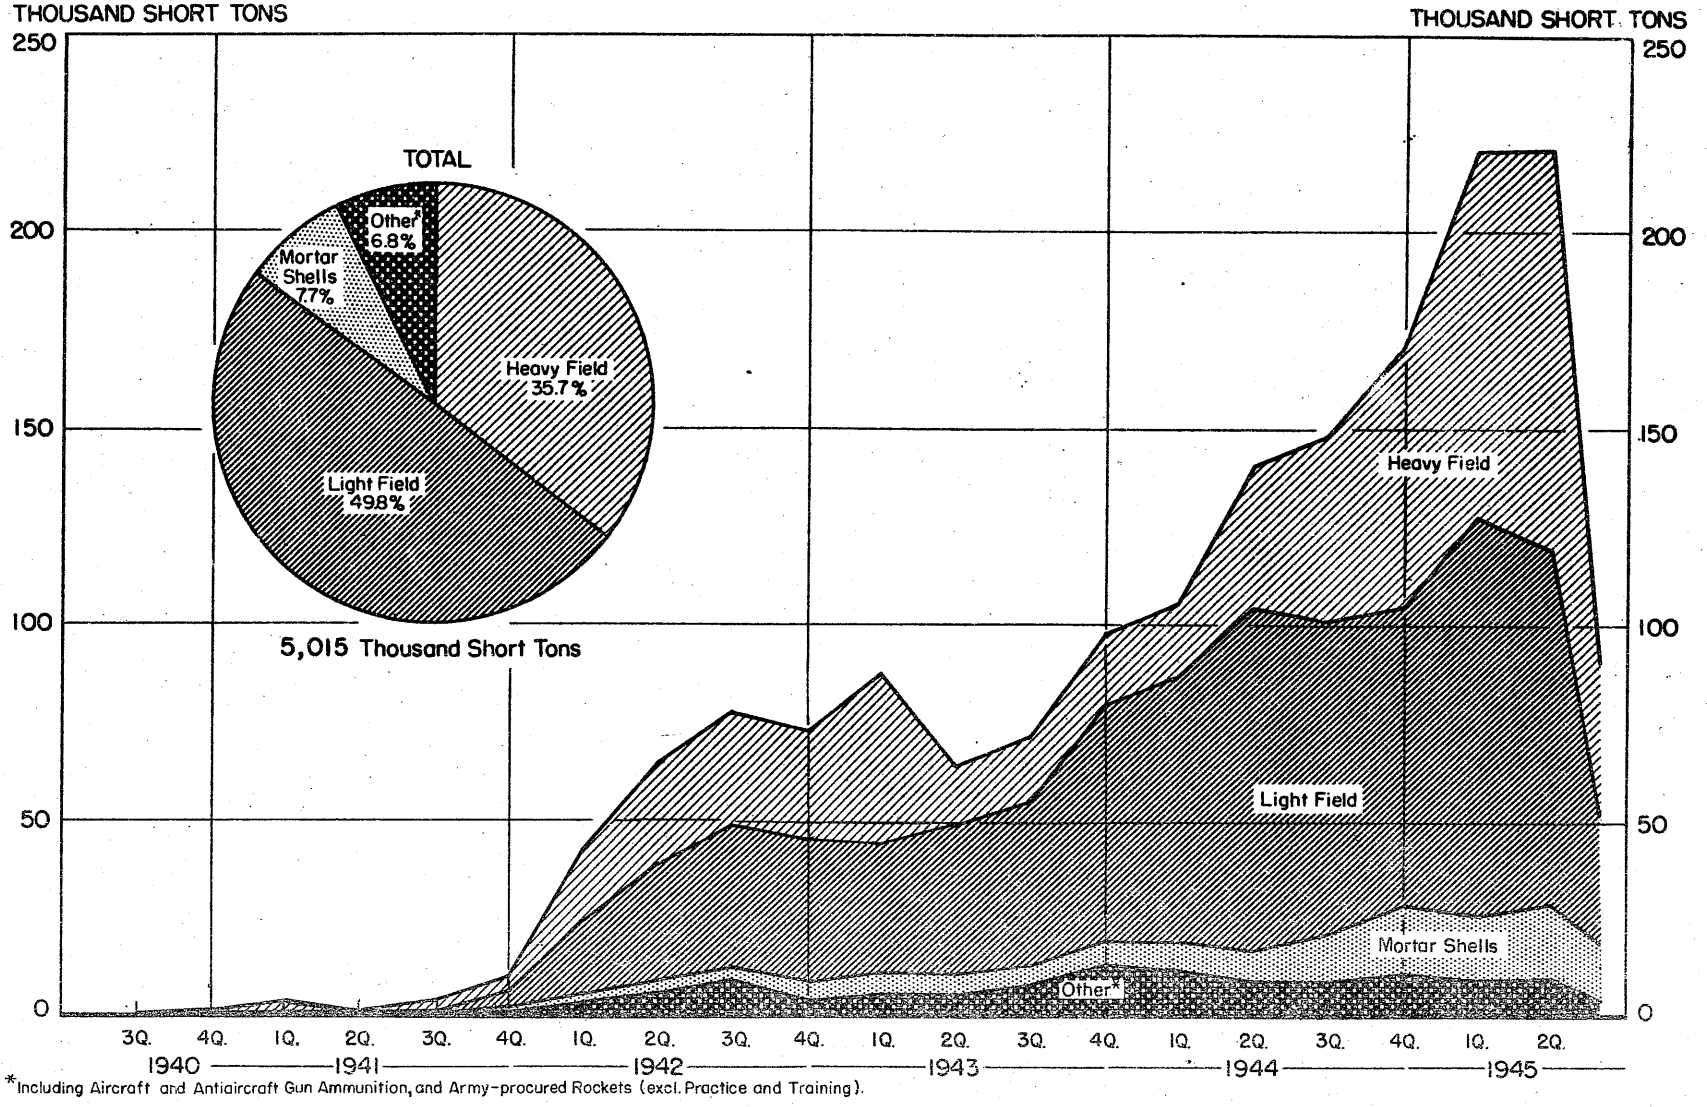
Unpublished data from the Production Statement Special Release, July 1, 1940–August 31, 1945, prepared by the Military Division, Program and Statistics Bureau, War Production Board.

CHART VII

TONNAGE OF U.S. ARMY GUN AND MORTAR AMMUNITION PRODUCED

AVERAGE MONTHLY PRODUCTION, BY QUARTERS

JULY 1, 1940 - AUGUST 31, 1945



*Including Aircraft and Antiaircraft Gun Ammunition, and Army-procured Rockets (excl. Practice and Training).

369

CHART VIII

TONNAGE OF U.S. NAVAL GUN AMMUNITION PRODUCED

AVERAGE MONTHLY PRODUCTION, BY QUARTERS

JULY 1, 1940 – AUGUST 31, 1945

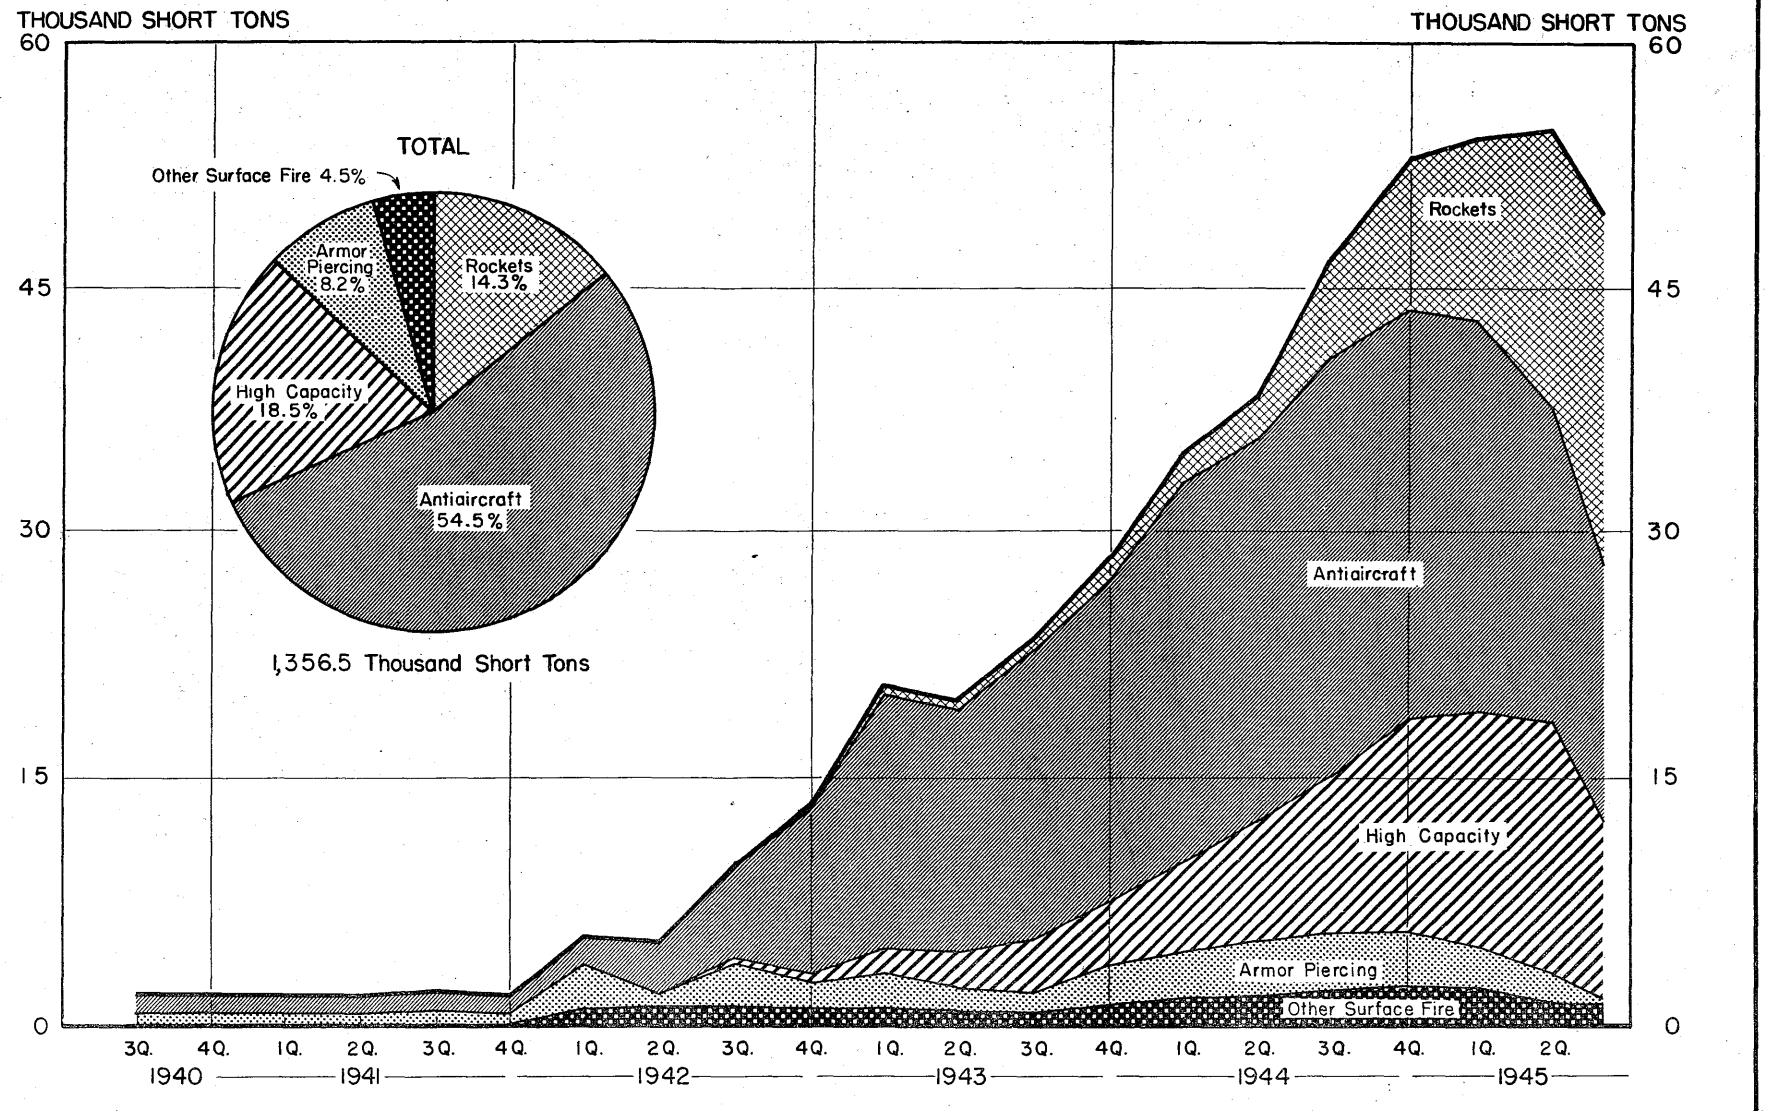


CHART IX

TONNAGE OF U.S. AIRCRAFT BOMBS PRODUCED

AVERAGE MONTHLY PRODUCTION, BY QUARTERS

JULY 1, 1940 - AUGUST 31, 1945

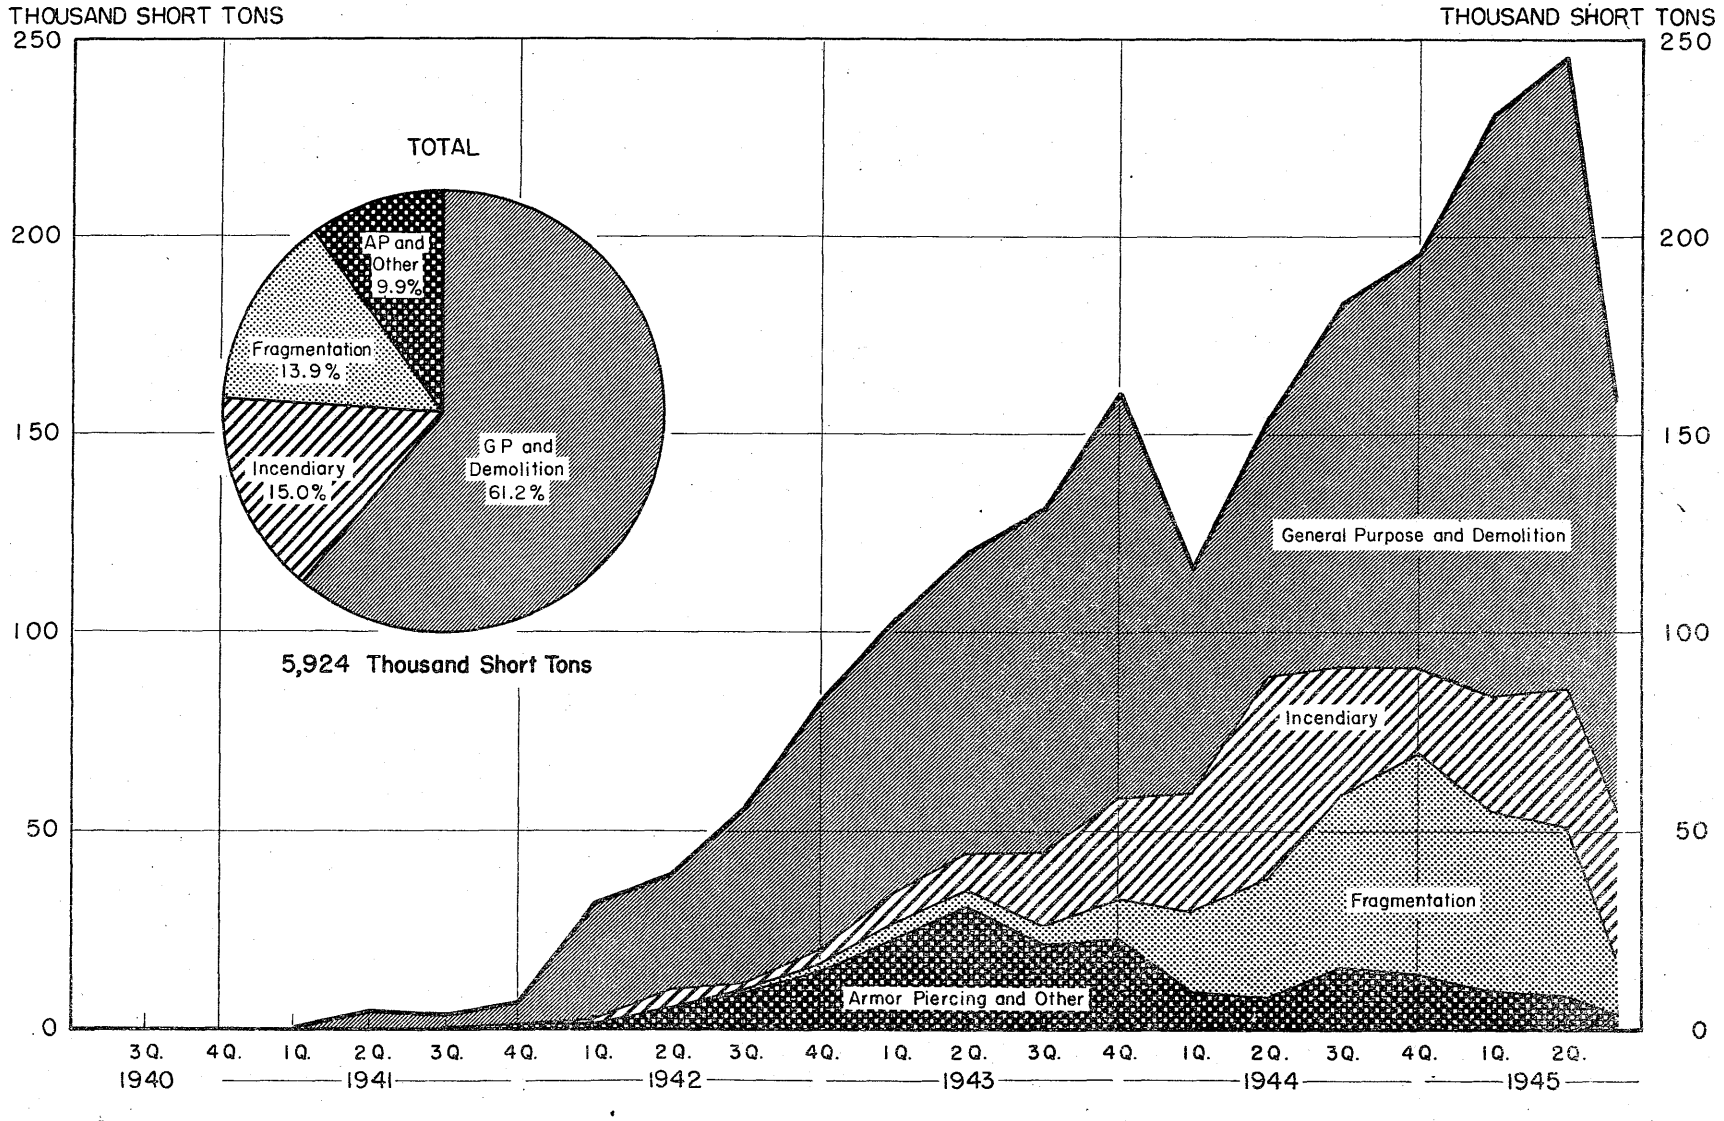

CHART X

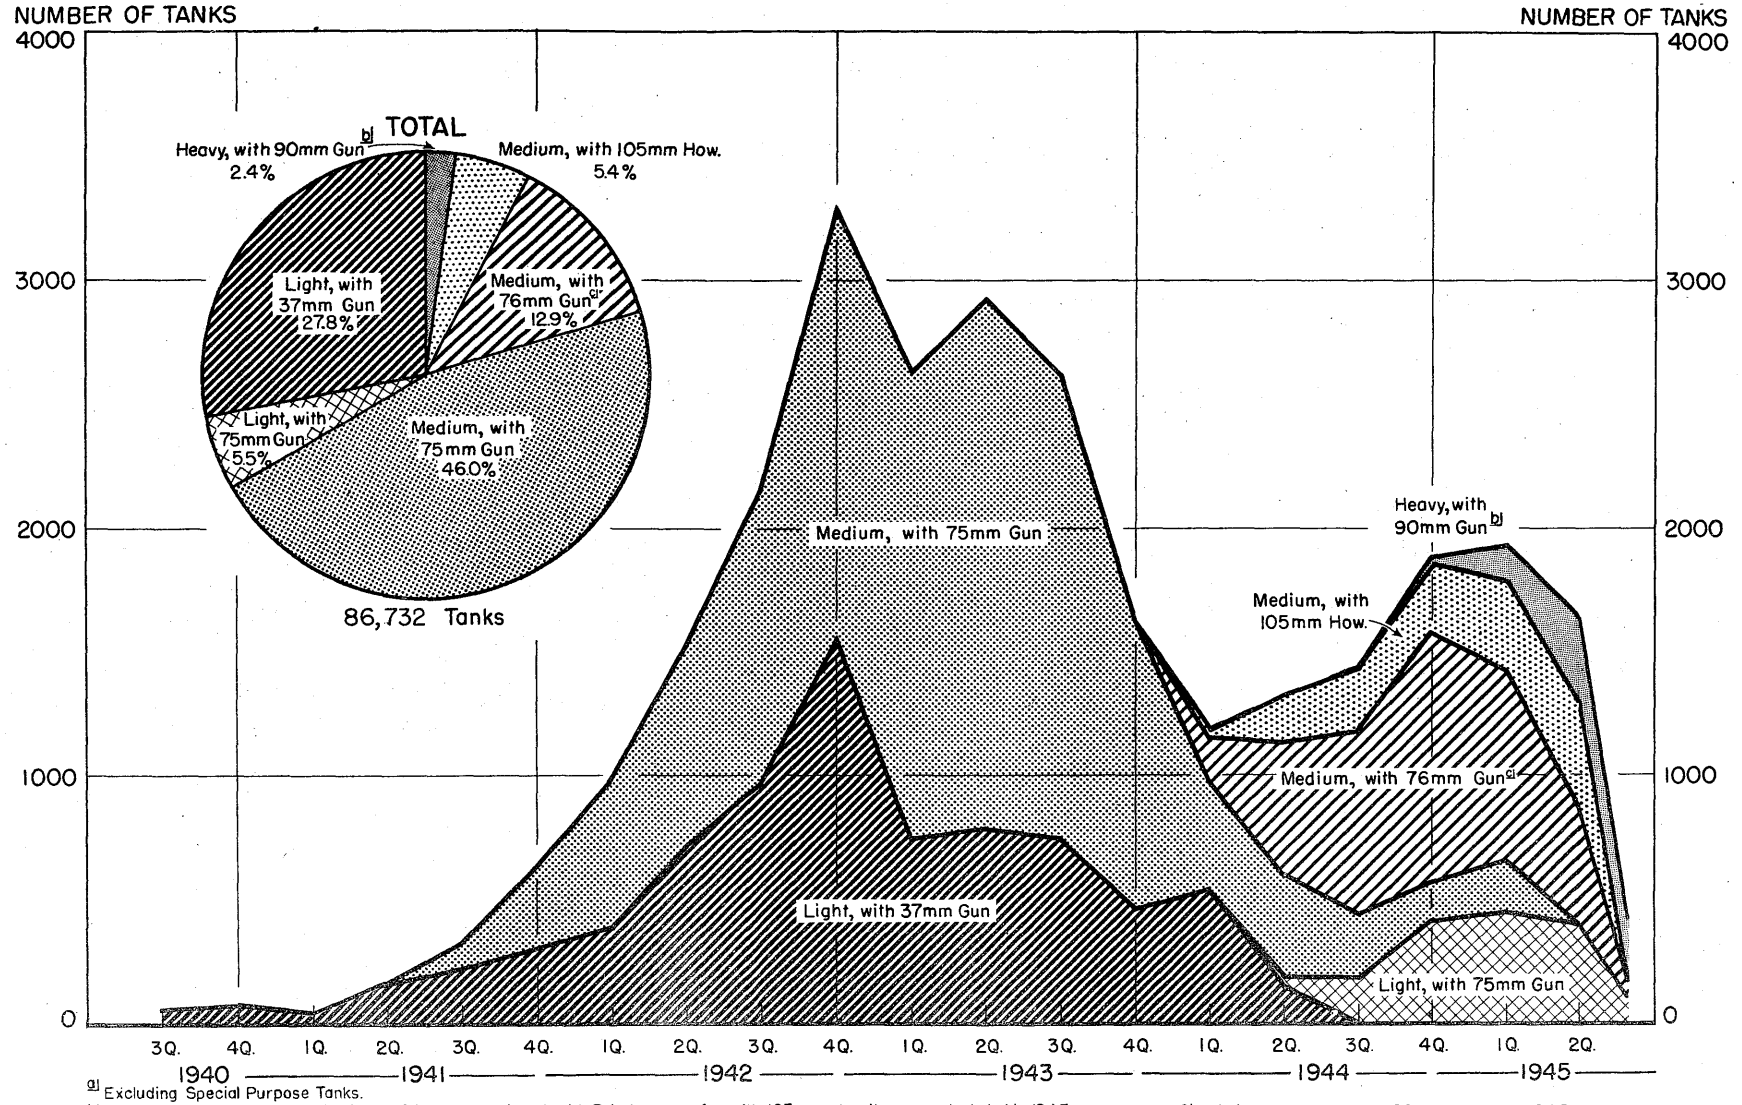
NUMBER OF U.S. ARMY TANKS PRODUCED [a]

AVERAGE MONTHLY PRODUCTION, BY QUARTERS

JULY 1, 1940 - AUGUST 31, 1945



[a] Excluding Special Purpose Tanks.

[b] The few heavy tanks produced prior to 1944 were equipped with 3-inch guns; a few with 105-mm howitzers are included in 1945.

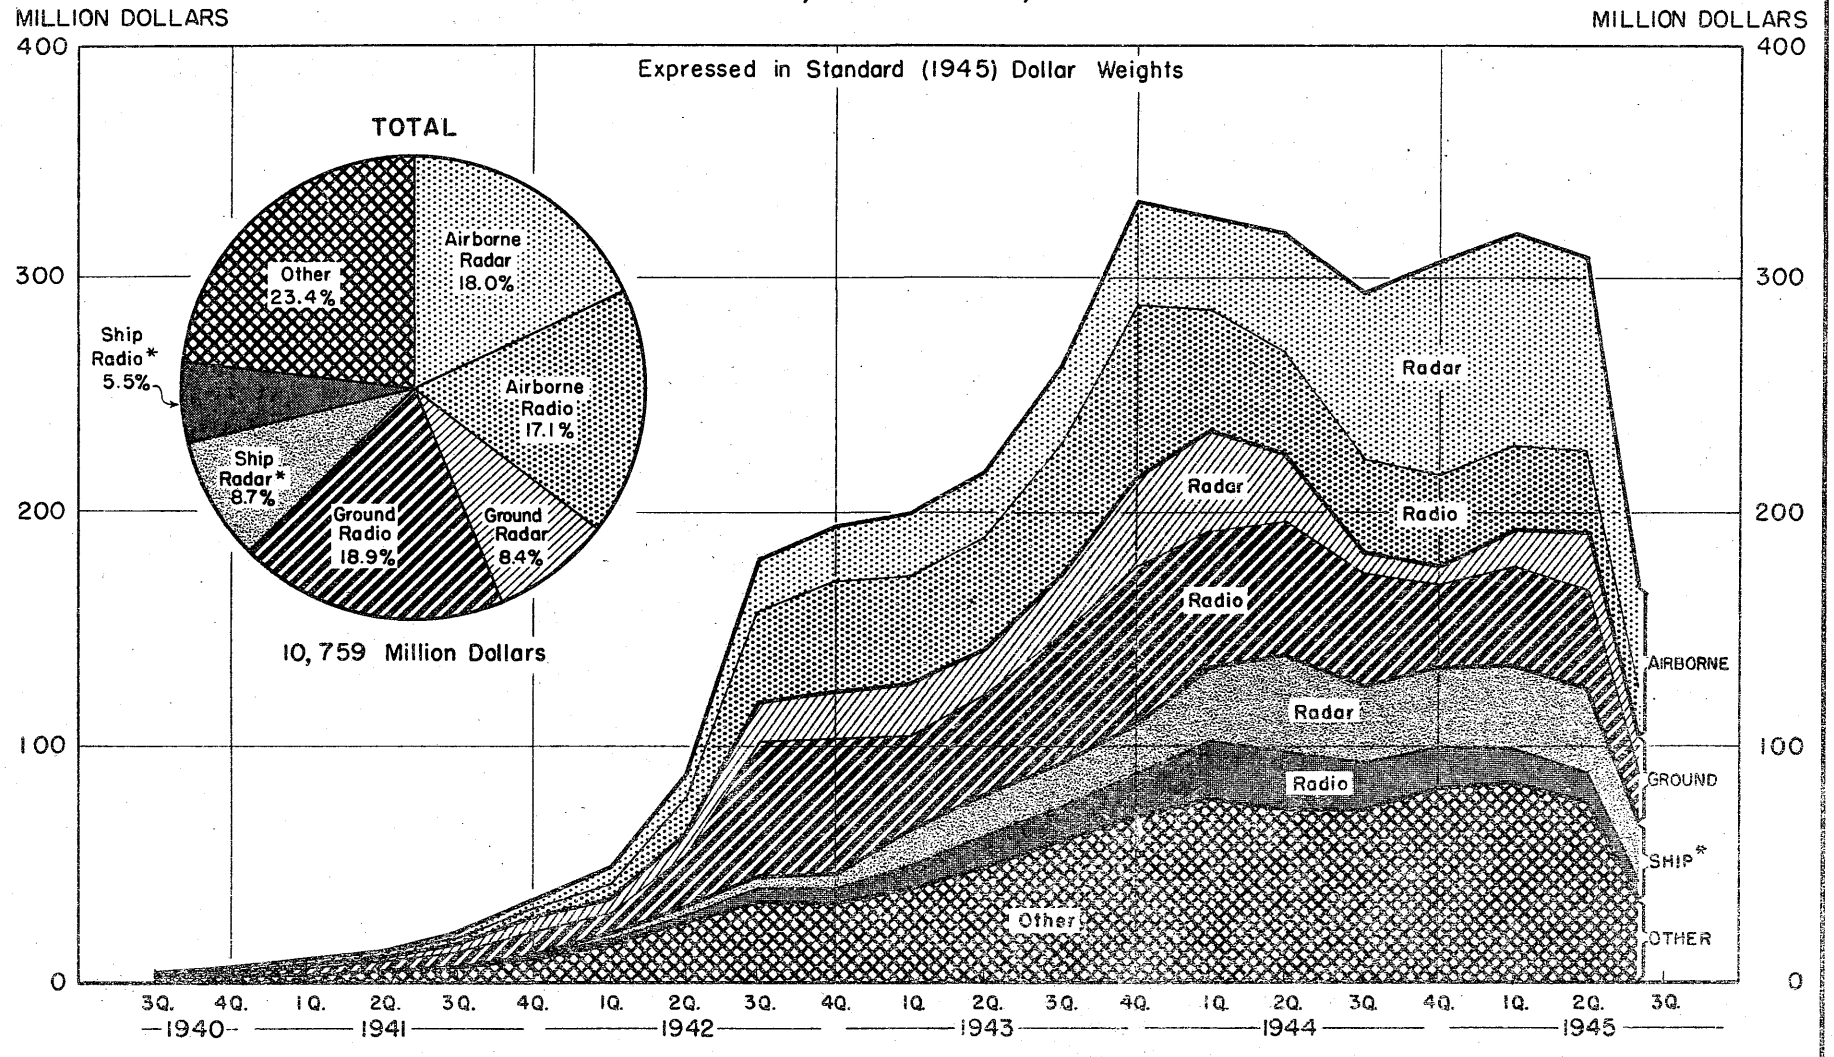
[c] Including some tanks with 90-mm guns, in 1945.

CHART XI

VALUE OF THE U.S. COMMUNICATIONS AND ELECTRONIC EQUIPMENT PRODUCTION PROGRAM

AVERAGE MONTHLY PRODUCTION, BY QUARTERS

JULY 1, 1940 – AUGUST 31, 1945



*Including Ship-and-Shore.

SOURCE: Unpublished data from the Production Statement Special Release, July 1, 1940 – August 31, 1945, prepared by the Military Division, Program and Statistics Bureau, War Production Board.

COMBINED U. S. - CANADIAN SUPPLEMENT

FOREWORD

This supplement presents data on combined United States and Canadian production for selected groups of important munitions items. Canadian production of items under U.S. contract is also shown in this supplement.

The classification of munitions items shown in this supplement is the same as that used in Official Munitions Production of the United States, to which this report is a supplement. Unless otherwise indicated in the footnotes or in the explanatory notes at the end of the report, United States data represent total production of all items carried in the specified category in the main report. Data on Canadian production are presented by individual items as well as in totals.

The explanatory notes at the end of this supplement provide additional information on the Canadian series presented in the following tables.

EXPLANATORY NOTES

Source of Data

United States

See sections in main report.

Canada

Canadian Department of Munitions and Supply, Economics and Statistics Branch, through the Combined Production and Resources Board and the Joint War Production Committee of Canada and the United States.

Description of Data

United States

See sections in main report. U.S. ammunition totals for artillery and mortars shown in this supplement exclude all shells produced primarily for the purpose of containing poison gas, use of which is forbidden by the Geneva Convention; such shells are not classified as munitions by the British or Canadians. The number of conversions included in the figures for particular categories of U.S. vessels are indicated in parentheses to the right of these figures.

Canada

Data on actual production represent, for most items, plant acceptances by inspectors of the Canadian Government or other procuring agencies. Naval vessels are reported as completed when construction has been completed at the building yard.

Production Financed by the United States

Canadian production data carried in this supplement represent total Canadian production within the categories covered, including that financed by contracts from the United States.

Canadian production under U.S. funds is shown in separate columns adjacent to figures for total Canadian acceptances. United States-financed production for any one item is, of course, no greater than total Canadian production of the item, but the actual acceptances in any one period may be greater due to the fact that acceptances are made at different stages of completion for some items, while others have a backlog of earlier Canadian production from which to draw.
